Design Document for NAEP Test-to-Test Studies

Design of Content Alignment Studies in Mathematics and Reading for 12th Grade NAEP and other Assessments to be used in Preparedness Research Studies¹

The purpose of this paper is to provide a detailed design to guide implementation of content alignment studies for the grade 12 National Assessment of Educational Progress (NAEP) in reading and mathematics with respect to other assessments that the National Assessment Governing Board plans to use to provide indicators for reporting preparedness of 12th graders on NAEP in these subjects. The alignment studies are to form a part of the evidence in a series of research studies designed to explore NAEP's capacity to produce and report valid data on the preparedness of 12th graders for post-secondary activities.

This design document addresses all key points that must be considered for implementing a content alignment study between two tests. NAEP is a highly visible assessment program, and the alignment studies are central to the 12th grade preparedness research. Because different assessments will be used, the Governing Board faces the challenge of developing alignment studies that produce comparable information. The Board wants to generate as much information as possible about the content relationship and alignment between NAEP and the other assessments of interest while also assuring that the information comparing NAEP across assessments is comparable. Whatever the process used to judge the content alignment between two assessments, the process should be transparent and replicable.

_

¹ The National Assessment Governing Board contracted the services of Norman L. Webb, Senior Research Scientist Emeritus, Wisconsin Center for Education Research, University of Wisconsin-Madison to develop this design document for use in a series of content alignment studies for the Grade 12 National Assessment of Educational Progress in reading and mathematics. Mr. Webb delivered a complete draft to the Governing Board on December 19, 2008. The draft document was reviewed extensively in January and February, 2009; and the Governing Board approved the design for implementation in the content alignment studies at the March 2009 meeting. Several modifications were made by Governing Board Staff to clarify specific points, to more fully reflect the Board's goals for the studies, and to respond to recommendations from reviewers. Staff thanks Mr. Webb for his generous assistance throughout this process and the many reviewers who helped the Board to reach closure on the choice of methodologies.

Alignment

Alignment in the current context of No Child Left Behind generally attends to the agreement in content between state curriculum standards and state assessments. In general, two or more documents have content alignment if they support and serve student attainment of the same ends or learning outcomes. More specifically, *alignment* is the degree to which expectations and assessments are in agreement and serve in conjunction with one another to guide the system toward students learning what they are expected to know and do (Webb, 1997, p. 3).

It is important to point out that alignment is an attribute of the relationship between two or more documents and less an attribute of any one of the documents. The alignment between a set of curriculum standards and an assessment could be improved by changing the standards, the assessment, or both. Alignment is intimately related to test "validity," most closely with content validity and consequential validity (Messick, 1989, 1994; Moss, 1992). Whereas validity refers to the appropriateness of inferences made from information produced by an assessment (Cronbach, 1971), content alignment refers to the degree to which content coverage is the same between an assessment and other curriculum documents.

Methods for Conducting Alignment Studies

Three methods represent the most prevalent approaches for judging the alignment between assessments and standards (Le Marca, Redfield, Winter, & Despriet, 2000). All three approaches employ from five to eight content experts as the panelists whose alignment judgments are used to determine the degree of alignment. One way that the approaches differ is in the judgments made by the panelists. In the process developed by Webb (2002), panelists assign the depth-of-knowledge level (level of complexity) to each objective underlying each content standard. Next the panelists map each item to the standards. The two steps in mapping items to content statements include having panelists independently assign a DOK level to an item on the assessment and then assign the item to up to three objectives. Panelists are to map an item to an objective only if content knowledge expected to satisfy the objective is necessary, at least in part, to answer the item correctly.

The Survey of the Enacted Curriculum (SEC) process, developed by Porter and colleagues, uses a comprehensive matrix of content topics by cognitive levels to analyze the content from different documents using a common content language (Porter, 2002 & 2006). Panelists map each objective underlying the standards to the cell in the matrix representing the most appropriate topic and cognitive level. Panelists can assign one objective to more than one cell as appropriate. Panelists also map each item to the appropriate topic-by-cognitive-level cell. The alignment, reported as an index value between 0 and 1, is the aggregation of the proportion of cells in common between the mapping of the content standards, the assessment, and/or the teacher's instructional objectives to the matrix. In this way it is possible to compare standards with assessments, and each of these with the enacted curriculum as described by the teacher.

The Achieve, Inc. protocol for analyzing the alignment between an assessment and content standards uses panelists to produce information on four alignment criteria—content centrality,

performance centrality, range and balance, and challenge (Rothman, Slattery, Vranek, & Resnick, 2002). The analysis begins with a content expert verifying the state's own alignment between the assessment and standards such as would be described in a test blueprint. Then panelists analyze and reach consensus on the relationship between each item and its assigned standard and objective as specified by the blueprint. Panelists reach consensus on the four alignment criteria for each item (content centrality, performance centrality, range and balance, and challenge). For content and performance centrality, panelists can agree that the item fully addresses the intent of the assigned objective, partially addresses the intent, or in no way addresses students' knowledge as expressed by the objective. Results are reported as the percentage of items with full, partial, or no content and performance centrality; whether the collection of the items is appropriately challenging to students at the given grade level; and whether some topics are over- or under- represented.

The three alignment procedures vary in terms of the information produced on the relationship between assessments and standards. The findings of the relationship between the assessment and standards from the Webb process are reported using four alignment criteria—Categorical Concurrence, Depth-of-Knowledge Consistency, Range-of-Knowledge Correspondence, and Balance of Representation. A distinguishing factor of the Webb process is that specific decision rules are used to determine if the alignment between content standards and the assessment is acceptable. The SEC process produces an index, ranging in value between 0 and 1, representing the overall alignment between the standards, the assessment, and the classroom curriculum. Findings from SEC are also reported as topographical maps and in other data displays, one for each document (standards, assessment, and curriculum) analyzed. The topographic maps can be viewed side-by-side to determine the variation in emphasis from classroom to assessment program to standards of topics by cognitive levels. Results derived from the Achieve, Inc. protocol are reported in a narrative including some tables showing results for the alignment attributes. The narrative reports the degree of alignment as determined through the consensus process, how the alignment could be improved, and any other relevant information.

Any of these three methods could be used to analyze the alignment between two assessments. However, the purpose for analyzing the NAEP with assessments of post-secondary education preparedness is to provide supporting information for the valid use of other assessments with grade 12 NAEP to interpret results and report findings regarding students' preparedness for higher education and workplace training. The Webb process, the most popular approach among states for comparing standards and assessments (Porter, 2006), provides independent judgments among panelists on the degree of alignment using multiple criteria—topic, complexity, range, and balance. The assessments can be mapped directly to the NAEP assessment framework. This produces information on the content within an objective or subtopic that is or is not targeted and it uses the terminology of the actual framework. Mapping both assessments to the same framework (e.g mapping both the NAEP and SAT mathematics assessments to the NAEP mathematics framework), the assessments can be compared according to the number of assessment items mapped to each content area, subtopic, and more detailed content levels; distribution of items from each assessment within each content area by levels of complexity; proportion of subtopics with at least some items from each assessment; and balance in emphasis (over or under) by assessment items of any objectives under a subtopic and content area in relationship to other objectives.

Both SEC and Webb system panelists independently analyze the assessments; but rather than mapping the items directly to an assessment framework, as in the Webb system, SEC panelists map items to a common framework or "language system." An advantage of the SEC is that an assessment would only need to be mapped to the SEC content-by-cognitive level framework. With the Webb process, an assessment would have to be mapped to each framework used in the comparison. After an assessment has been mapped with the SEC method, the assessment could be compared to any other document (assessment, framework, or curriculum) that has also been mapped to the SEC framework. A disadvantage to this method is that the alignment between documents is reported as a single index describing a holistic relationship between documents. However, graphic representations of the mappings can be displayed to represent comparability of specific topics by cognitive levels for any of the alignments examined.

The Achieve system depends heavily on verifying the alignment of the assessment to a blueprint or framework, and the protocol would require major modifications to be adapted for an assessment to assessment analysis. The Achieve methodology would be less suitable for the goals of the Governing Board than either of the other two common alignment procedures.

Both the Webb process and the SEC have advantages and disadvantages. Both have computerized tools that can be used to enter and analyze data. Both produce measures of reliability among panelists. The SEC would require fewer analyses, but would produce less information on the degree of alignment. The Webb process will require mapping assessments to different frameworks, but will produce more detailed information. Both methods are transparent and replicable. Of these two systems, the Webb process is more suited to the Governing Board's goal of maximizing information about the degree to which the NAEP assessments are aligned with other assessments.

Alignment of NAEP Assessments to Other Assessments

Different methods can be used for judging the alignment of the NAEP assessments in reading and mathematics with assessments measuring preparedness for post-secondary activities. The Webb process is a content analysis. Two assessments are aligned to the degree that the two assessments are judged by a group of panelists to target the same content knowledge at a similar level of complexity. Note that content complexity is different from content difficulty. Content complexity is influenced by the structure of the content and performance expectations. An assessment item is more complex if the item requires knowledge of multiple concepts and ideas, if the answer can be derived in many ways, and if generalization is required. Difficulty is a psychometric term related to student performance on an item and is reported as the percentage of students who correctly answer an item. Difficulty is related to complexity, but it can depend on other factors such as the speediness of the test, opportunity to learn, and item format.

Most tests of student content knowledge are composed of a sample of items from some content domain. It is possible to have distinct tests that serve common purposes and produce comparable measures of students' content knowledge. For two or more tests to have content alignment and

similar content coverage, the tests should sample content knowledge from the same content domain.

Alignment criteria (Webb, 1997) used to analyze the alignment between tests and curriculum documents can also be used to judge the alignment between two or more tests:

- Categorical Concurrence—The same or consistent categories of content appear in both assessments.
- Depth-of-Knowledge Consistency—The same depth of content knowledge is elicited from students by both assessments.
- Range-of-Knowledge Correspondence—A comparable span of knowledge within topics and categories is targeted by both assessments.
- Balance of Representation—A similar emphasis, indicated by the number and weighting
 of assessment items, is given to different content topics and subtopics on each
 assessment.

In judging the alignment between two assessments, these alignment criteria should be applied relative to a content domain. A test of students' content knowledge generally is designed to produce information on student performance related to a content domain by sampling content knowledge. The results from the assessment are used to make inferences about student knowledge relative to a content domain, as generally described in an assessment framework or blueprint. Because of the vastness of the possible items that could be used to assess students' knowledge of a domain, it is unlikely that any two assessments targeting the same domain will have precisely the same items. Thus, any item-by-item comparison between two assessments could result in a minimal match between the assessments. The likelihood of an item-by-item match between two assessments would be expected to decrease as the differences in the purposes of the two assessments increase. NAEP is designed to monitor educational progress in the nation, whereas other tests of interest to 12th grade NAEP preparedness research are designed with a more narrow purpose of predicting success of students in higher education or placing students in college courses, for example.

The approach for analyzing the alignment of the NAEP mathematics and reading assessments to other assessments, as described here, is designed to compare the assessments by how the items represent content domains. For mathematics, five content areas specified in the 2009 NAEP Mathematics Framework (National Assessment Governing Board, 2008a) serve well as content domains for comparing the alignment between two or more tests:

- 1. Number Properties and Operations
- 2. Measurement
- 3. Geometry
- 4. Data Analysis, Statistics, and Probability
- 5. Algebra

Exhibit 1: Content areas specified in the 2009 NAEP Mathematics Framework.

For reading, the cross-section of the aspects of reading and the context of reading specified in the NAEP Reading Framework for 2009 (National Assessment Governing Board, 2008b) can serve as content domains. The aspects of reading in the Reading Framework are:

- 1. Locate and recall
- 2. Integrate and interpret
- 3. Critique and evaluate

The text types are represented in the text matrix below.

Grade 12 Reading Text Matrix

| | | Text Structures and | |
|-------------------------|---|---|---|
| | Genre/Type of Text | Features and | Author's Craft |
| Fiction | Satire Parody Allegory Monologue Plus increasingly complex application of grades 4 and 8 | Organization Differentiation of plot structures for different purposes and audiences Elements Interior monologue Unreliable narrators Multiple points of view Plus increasingly complex application of grades 4 and 8 | Dramatic irony Character foils Comic relief Unconventional use of language Plus increasingly complex application of grades 4 and 8 |
| Literary Non-Fiction | Classical essay Plus increasingly complex application of grades 4 and 8 | Increasingly complex application of grade 4 | Denotation Connotation Plus increasingly complex application of grades 4 and 8 |
| Poetry | • Sonnet • Elegy Plus increasingly complex application of grades 4 and 8 | Elements | Denotation Connotation Irony Tone Complex symbolism Extended metaphor and analogy Plus increasingly complex application of grades 4 and 8 |
| Exposition | Essay (e.g., political, social, historical, scientific, natural history) Literary analysis Plus increasingly complex application of grades 4 and 8 | Increasingly complex application of grade 4 | Denotation Connotation Complex symbolism Extended metaphor and analogy Paradox Contradictions and incongruities Ambiguity Increasingly complex application of grades 4 and 8 |

Exhibit 2: Type of Text, Text Structures and Features, and Author's Craft for Grade 12 from the 2009 NAEP Reading Framework.

For mathematics, the content areas are further delineated by subtopics and objectives. These more precise statements of content knowledge can then be used to compare the range or span of knowledge within content areas assessed by a test. For reading, the element of texts, reading skills, and reading passages add more detailed specifications, although neither the framework nor specifications provides detailed objectives for student achievement. The preliminary achievement levels definitions for reading are a potential source of this level of detail for reading.

The process for analyzing the alignment between NAEP and other assessments is designed to determine the *degree* of alignment. Most likely, two assessments will overlap in content coverage with some content common to both assessments and other content unique to each assessment (Exhibit 3).

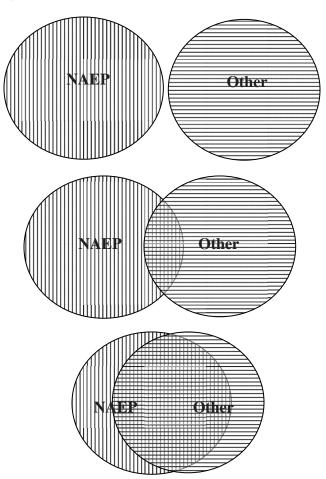

Exhibit 3: Depiction of different degrees of alignment between NAEP assessment and another assessment.

The purpose of the alignment analysis is to determine both the extent of the overlapping content knowledge targeted by each assessments and the extent of the content knowledge that is unique to each assessment. The alignment criteria provide a basis for reporting what is common between

two assessments and what is different—the categories or topics, the depth-of-knowledge or cognitive level, the range or breadth, and the degree of emphasis. The process includes using the NAEP framework as a representation of the content along with using the framework of the other assessment as a representation of the content. This will allow each assessment to be compared using the language system of the NAEP framework and the language system of the framework for the other assessment referred to hereafter as *Pexam*. This bidirectional analysis will be particularly helpful in determining the categorical concurrence, range, and balance of each assessment relative to each framework and to each other. It is possible that the analysis will show there is little or no alignment between the NAEP assessments and any Pexam.

Determining the Degree of Alignment Using the Four Criteria

The categorical-concurrence criterion provides a very general indication of alignment if both documents incorporate the same content. *The criterion of categorical concurrence between assessments is met if the same or consistent categories of content appear in both assessments.* This criterion is judged by determining the number of items each assessment includes for each content area and subtopic. Two assessments agree in categorical-concurrence if the proportion of items from each assessment assigned to each content category is similar.

Two assessments can be aligned not only on the basis of the content covered by each, but also on the basis of the complexity of knowledge required by each. *Depth-of-knowledge consistency between two assessments indicates alignment if the cognitive demand of the two assessments is approximately equal.* For consistency to exist between two assessments, as judged in this analysis, the proportion of items at each level of complexity should be similar for the main content categories and subcategories.

For two assessments to be aligned, the breadth of knowledge required on both should be the same, or very nearly so. The range-of-knowledge criterion is used to judge whether a span of knowledge expected of students on one assessment is the same as, or very nearly the same as, the span of knowledge expected of students on the other assessment. The range criterion considers the proportion of subcategories (e.g. subtopics or objectives) under a content category (e.g. content area or standard) with at least one corresponding assessment item. The range of knowledge is comparable between two assessments if the proportion of subtopics assessed is the same or similar.

In addition to comparable depth and breadth of knowledge, aligned assessments require that knowledge be distributed equally in both. The range-of-knowledge criterion only considers the number of subcategories within a content category hit (a subtopic with a corresponding item); it does not take into consideration how the hits (or assessment items/activities) are distributed among the subcategories (e.g. subtopics or objectives). *The balance-of-representation criterion is used to indicate the degree to which one content subcategory is given more emphasis on one assessment than the other assessment.* An index is used to judge the distribution of assessment items among subcategories underlying a content category. An index value of 1 signifies perfect balance and is obtained if the corresponding items related to a content category are equally distributed among the course-level expectations for the category. Index values that approach 0 signify that a large proportion of the items only correspond to one or two of all of the

subcategories with at least one assigned item. Two assessments have comparable balance of representation if the distribution of items among subcategories is the same as determined by a comparable index value.

The overall alignment between two assessments is determined by similar values on all four alignment criteria.

Design of Alignment Study

The major components of an alignment study to be addressed in this design include:

- specification of the content domains for the comparison of two assessments
- specification of the criteria to be used to determine the degree of alignment between two assessments
- process for panelists to conduct the analysis
- means for analyzing and reporting the findings

The Webb alignment process will be used for analyzing the alignment between the 12th grade NAEP in mathematics and reading and the post-secondary assessments (Pexams). This process includes using the depth-of-knowledge (DOK) levels definitions (see Appendices B and C) in mathematics and reading to assign levels of complexity to assessment items and objectives; having a group of trained panel members conduct the analysis; assigning levels of complexity to objectives or expectations in each assessment framework; assigning DOK levels and content objectives to assessment items; and analyzing and reporting the results using four alignment criteria (categorical concurrence, depth-of-knowledge consistency, range-of-knowledge correspondence, and balance of representation). The Web Alignment Tool (WAT) (http://wat.wceruw.org/) is recommended for collecting the data from panelists and conducting analyses, but the choice of analysis instrument is not critical to the outcome of the study so long as all the data are collected and computations are performed in the same manner.

A key reason for analyzing the alignment between two assessments is to determine the extent to which the two assessments target the same content domains or the extent to which inferences can be drawn from students' performance on one assessment regarding their capacity to perform in a comparable content domain on another assessment. The NAEP frameworks for both mathematics and reading specify the content domains to be used in developing items and selecting them for the NAEP. Using these NAEP frameworks as the content structure provides one means of analyzing alignment and drawing conclusions about alignment between the NAEP assessments and other assessments mapped to the NAEP framework. Using the framework of the other assessments to be compared to NAEP provides another basis for the analysis of the relationship between the two assessments.

In the Webb alignment approach, panelists map items from an assessment directly to the assessment framework. After the items are mapped to the framework, it is then possible to describe the content categories (objectives, topics, and so forth) that were not targeted by the assessment. The purpose of mapping items to the assessment framework is not to evaluate the quality of the items or the validity of the assessment; rather, it is to establish a basis for

comparing the two assessments. This process of mapping items to frameworks results in additional information on the match of an assessment to a framework that is more detailed than would be the case if the alignment were based on framework objectives or other higher-level attributes of the framework or item specifications. Four item mapping/coding procedures for each subject assessment are called for in this design:

- 1. NAEP items to the NAEP framework
- 2. Pexam items to the NAEP framework
- 3. Pexam items to the Pexam framework
- 4. NAEP items to the Pexam framework

Panels

The study is to have two groups of six to eight panel members each for each subject independently analyze the assessment frameworks and the assessment items during a period of approximately five days. The panels should be equivalent in terms of area of content expertise, level of content expertise (secondary/post-secondary), and demographic attributes. Racial-ethnic and geographic diversity should characterize the panels.

Data are to be analyzed to determine the consistency in the results for the two groups. The two groups will initially and primarily operate independently. The results from the two groups will serve as a replication of the alignment judgments.

Having two groups complete the alignment analysis concurrently allows a real-time check on the replicability (i.e., the reliability) of the findings. If the findings from both groups are comparable, then greater confidence is assigned to the results. Having the groups perform the analysis at the same time allows the opportunity for on-site adjudication and resolution regarding how specific aspects of assessments are to be interpreted. Decision rules must be developed in advance so that instructions can be prepared to train panelists and avoid ambiguous situations that may be confusing and inefficient. In the event that questions arise, however, the alignment results will be based on the on-site resolution and adjudicated data collected for the two panels.

To evaluate the content alignment of 12th grade NAEP to the other assessments, several tasks must be accomplished. The following tasks are to be included in each study. An agenda is included in Appendix A to provide an estimate of the amount of time needed for the various tasks included in this study.

Tasks

- Task 1 Date and location for conducting the studies set, including arrangements for required meeting facilities.
- Task 2 Qualified panel members (6-8 for each of two replicate panels for each subject) recruited and confirmed; one expert group facilitator for each replicate panel (2 for each subject) contracted.
- Task 3 Materials prepared for training panelists and collecting and recording data. Data analysis software (e.g. WAT) prepared by entering the components of each framework into the software which will have been customized to capture findings in Task 4 (comparisons of test specification documents) and to capture findings of partial coverage along with codes for panelists' rationales for alignment judgments.

- Task 4 Comparative analysis of the pairs of test blueprints (NAEP and Pexam) conducted by an expert for each subject.
- Task 5 Panel members trained in DOK level definitions and assignment of items to key framework components for each assessment for each subject.
- Task 6 Panel members trained to use the WAT (or comparable software) features and procedures.
- Task 7 Panel members assign DOK levels to NAEP framework components and reach consensus on these. DOK agreement is reached between the DOK levels assigned by the replicate groups.
- Task 8 Panel members map 2009 NAEP item pool to the grade 12 NAEP framework objectives for the subject.
- Task 9 Panel members respond to de-briefing questionnaire about alignment of NAEP item pool to NAEP framework.
- Task 10 Facilitators review codings and determine whether there are discrepancies in assigning items to objectives and in the results on the four alignment criteria; panelists adjudicate discrepancies.
- Task 11 Panel members map each of two forms of the Pexam to grade 12 NAEP framework.
- Task 12 Panel members respond to de-briefing questionnaire about alignment of Pexam items to NAEP framework
- Task 13 Facilitators review codings and determine whether there are discrepancies in assigning items to objectives and in the results on the four alignment criteria; panelists adjudicate discrepancies
- Task 14 Panel members complete final debriefing questions about the content similarities and differences between the NAEP items and the Pexam items relative to the NAEP framework.
- Task 15 -
- Task 22 Same as Tasks 7-14, using Pexam framework for mapping items for evaluation of alignment.
- Task 23 Alignment study team analyzes the data collected at the study and the document comparisons of the NAEP and Pexam assessment frameworks.
- Task 24 Alignment study team writes the final reports indicating how the NAEP and Pexam assessments are aligned and how the two assessments are not aligned. There will be one report for each subject assessment.

Some of the tasks listed above are explained in more detail below.

Task 4 Comparative Analysis of Test Blueprints: An expert for each subject will conduct a comparative analysis of the pairs of test blueprints (NAEP and Pexam). The comparative analysis of the test blueprints for NAEP and the available blueprints for all other tests to be included in the analysis is to be done prior to the item analysis. The main purpose of the blueprint comparative analysis is to identify the similarities and differences in the content specifications, item types, reading passages, and other specifications used in the design of each assessment. The comparative analysis is to specify the content organization for identifying items to be included on the NAEP assessment and the Pexam comparison assessments. For example, the mathematics framework for NAEP organizes the mathematics domain into five content areas which are further divided into subtopics and objectives (National Assessment Governing Board,

2008a). The reading framework for NAEP organizes the reading domain by type of texts (fiction, non-fiction, expository, etc.) and features of texts. Within the cells formed by the types of texts and the features of texts, content is further specified by skills and elements--such as theme, major characters, and major events). (National Assessment Governing Board, 2008b).

In the comparative analysis, a side-by-side chart of the content organization is to be prepared that will display how the content structure used for the construction of each assessment is the same or different. The content comparative analysis is to identify differences in the topics included in one set of specifications but not in the other, such as the range and type of numbers for mathematics and the elements in reading. The analysis is also to indicate the grain size, or degree of specificity, in identifying the content for each assessment and how these are similar or different. It is possible that the content specifications between NAEP and another assessment address the same topics, but that one set of specifications does so at a more sophisticated level of specificity. In addition, the content comparative analysis is to determine how the performance specified in one framework is expected to differ from the performance in the other framework. One framework may specify that students are to be assessed on writing a variety of numbers, whereas the other framework specifies that students are to be assessed on reading and writing numbers. Finally, the content comparative analysis using a side-by-side chart should point out any inconsistencies found within each of the frameworks included in the analysis. For example, a standard may state that students are to analyze characteristics of real numbers, whereas all of the underlying objectives only require that students represent or use applications involving rational numbers.

The comparative analysis should also identify other characteristics of items as specified in the assessment framework and test specifications documents. The characteristics should include:

- 1. Number and proportion of items for each item format (multiple choice, short constructed-response, extended constructed-response, and any other types of items)
- 2. Scoring rubrics and rules for constructed-response items
- 3. Resources available to students (e.g. calculators, dictionaries, etc.)
- 4. Reading difficulty and grade-level targeted by items
- 5. Information about reading passages (original source, authentic texts, length, number of items per passage, organization of items within passages, etc.)
- 6. Information about test administration (when the assessments are administered, amount of time targeted for the assessments, time constraints, accommodations allowed, and the like)

The comparative analysis should be fully documented and presented in an interim report. (See the *Reports* section on page 25.)

<u>Task 5 Training of Panel Members:</u> Panel members need to be fully trained for the alignment tasks. The training should begin with an overview of the alignment process. The overview should include instruction in the following features of the process:

- 1. What is meant by alignment between an assessment and an assessment framework and between two assessments
- 2. The four alignment criteria used to determine the degree of alignment
- 3. Levels used for each criterion to specify the acceptable alignment overall
- 4. The steps in the alignment evaluation process

- 5. The general definition of depth-of-knowledge (DOK) used to identify content complexity, as well as specific definitions for the assessment
- 6. Illustrations of DOK levels assigned to content expectations (framework level) and specific objectives and items
- 7. Illustrations of DOK levels assigned to assessment items of each type
- 8. Coding rules, including the maximum number of content expectations to which one item may be coded, the implications for coding items to more than one content expectation, requirements for coding an item to a specific content expectation
- 9. How to produce good notes to document coding rationales, questions, and so forth
- 10. Source-of-challenge issues that should be noted, such as construct irrelevant features that may inadvertently cause an item to be more or less difficult or shift the cognitive demand away from the intended target.
- 11. The use of generic objectives in the event that a panelist judges that an item does not fit any content objective or expectation
- 12. Login procedures and navigation guidance for the data entry and analysis software (e.g., the WAT)
- 13. Other administrative details

The subject matter facilitators should determine when the group has a sufficient understanding of the DOK levels. It is not necessary for all panel members to have a precise understanding of the DOK levels until panelists are about to assign DOK levels to the NAEP objectives and elements/skills in the NAEP framework (or the first DOK assignment task).

<u>Task 6 Use of the Software/Analysis Tool:</u> The panel members should logon to the WAT (http://wat.wceruw.org/) or similar software analysis tool selected for this purpose. The analysis tool must be configured before the alignment panelists are convened so that members of each group are registered in the system and ready for login. Quality control procedures and advance planning are essential for the successful use of this tool by panelists.

<u>Task 7 Assign DOK Levels to NAEP Objectives:</u> Panel members in each of the two replication groups will independently assign DOK levels to the objectives under the content areas and subtopics for mathematics or the elements and skills under the contexts and aspects for reading. Panelists will use the WAT or other software/analysis tool to record the DOK levels assigned to each objective/element/skill in the NAEP framework.

Once all of the panelists have coded the DOK for each objective/element/skill, the group facilitator will print the results, listing the code assigned for each panel member. Any objective/element/skill without full agreement should be discussed to reach consensus for the group on the assigned DOK level. Reaching true consensus among panel members is an important goal because the process affords the panel members the opportunity to discuss the fine points for each objective/element/skill. The group facilitator must be trained in the process and assure that all panel members provide input.

After the two groups have determined the DOK levels for each objective/element/skill listed in the NAEP framework, the two group facilitators will meet to review the results and identify any differences between the two groups. The group facilitators will discuss the rationales provided

in each group and decide on the DOK level with the most compelling reasons. In the absence of a compelling reason, the DOK level assigned by the majority across the two groups will be used. Note that this adjudication process is conducted by the group facilitators and requires time in the agenda when panelists are not convened. The final DOK level assignments will be reported to panel members and panelists have the opportunity for discussion.

Task 8 Map the NAEP Items to the NAEP Assessment Framework: Next, the panel members should independently map the full 2009 NAEP item pool to the NAEP framework. To assure that the panel members are comfortable with this process, the group facilitator should select several items from the assessment for panel members to code for practice (individually, with pencil and paper). The sample items should be selected to represent the range of content, item formats, and other aspects of the assessment. The group facilitator will then have the panel members review and discuss briefly the codes assigned to map these items to assure panelists understand and agree on the procedures for coding items.

Once the facilitator is comfortable that panel members are correctly mapping items to the objectives/elements/skills, the panelists continue mapping the items by assigning a DOK level to each item and mapping the item to up to three objectives. A questionnaire should be developed to document the level of understanding and confidence panelists have before starting the coding process and after they have completed the task. In assigning an item to an objective, it is important that at least some of the content addressed in the objective is *necessary* in order to answer the item correctly. An item should not be mapped to an objective if the content knowledge in the objective is only relevant—and not necessary. For example, a question may require students to interpret the slope between two points although students could correctly answer the question by constructing an equation. This item should be assigned only to an objective about "determining the slope of a line" and not to an objective about "writing a linear equation."

It is critical that panel members apply the rule that content knowledge as expressed in an objective is absolutely necessary to answer the item correctly in order to map an item in the objective. If content knowledge from more than one objective is absolutely necessary to correctly answer an item, then the item can be assigned to one primary objective and up to two secondary objectives. When an item is assigned to multiple objectives, the item is weighted by the number of objectives. That is, the computations for Categorical Concurrence, Range, and Balance will incorporate all of the assigned objectives. If one item is assigned to two objectives, then both objectives are counted as a hit for Categorical Concurrence.

Panel members typically need about two minutes to code a multiple-choice item and about five minutes to code a constructed-response item. For constructed-response items, the panelists should consult the scoring rubric and the anchor items to assign codes.

<u>Task 9 Panel Members Respond to a De-Briefing Questionnaire:</u> Panel members should individually respond to a small set of questions after the items have been coded to the NAEP objectives. These debriefing questions are designed to elicit from the panel members more detailed information about how the collection of the items aligned to the objectives. Questionnaires should be structured to include both Likert-type scale responses and open-ended

responses. Questions to be used include, but are not limited to the following. Additional questions may be recommended.

- (a) For the objectives under each content area, did the items cover the topics identified by the objective? If not, what topics were not assessed?
- (b) For the objectives under each content area, did the items cover the most important performance (DOK levels) you expected by the objectives? If not, what performance was not assessed?
- (c) What is your general evaluation of the alignment between the content areas and the assessment: Highly Aligned; Moderately Aligned; Minimally Aligned; Not at all Aligned? If less than moderately aligned, what are some of the overlapping or non-overlapping features of the assessments that caused you to reach this determination?
- (d) What additional comments do you have about the alignment between the assessment and the framework?

Question (a) determines if an important part of an objective/element/skill was not assessed in any way. It is possible for an assessment to have items that only partially target the full intent of an expectation. For example, a mathematics objective may expect students to represent real numbers using exponents, scientific notation, absolute values, graphs, and the number line. However, if the assessment had items that only targeted the use of the scientific notation, then the objective would only have been partially addressed. The typical coding scheme for the Webb method does not require that panelists indicate the degree to which objectives are only partially addressed, and that will be changed as a part of Task 3 to collect this information for the NAEP content alignment studies, along with the rationale of each panelist for this judgment. Coding for partial coverage will help to maximize information about the relationship between the two assessments, particularly since mapping one assessment to another assessment's framework will likely yield several partial hits. The intent of the first debriefing question is to have the panelists identify parts of objectives that were not assessed in any way, such as the use of exponents in this example.

The second question (b) is similar to the first debriefing question, but it seeks to ascertain if panelists judge that the assessment is targeted to the performance identified by the objective. Having panel members give their overall evaluation of the alignment between the assessment and the assessment framework provides a holistic judgment by people who have just finished thinking very deeply about the relationship of the two. This evaluation provides more detailed information to enhance the interpretations of the alignment data. This evaluation is not intended as an indicator of the validity of the assessment instrument.

Task 10 Facilitators Determine Discrepancies and Panelists Adjudicate: After all panelists have completed mapping all of the NAEP items to the NAEP framework, the group facilitator should review the codings from the group and conduct an adjudication process for discrepancies in either assigning items to objectives/elements/skills or DOK levels to items. Discrepancies that should be discussed are those items that have not been assigned by more than half of the panelists to the same objective/element/skill or items that have been assigned to three different DOK levels or to two non-contiguous DOK levels.

Content complexity is a continuum. The Webb alignment process uses the average DOK among the panelists for analysis. It is reasonable for panelists to assign adjacent DOK levels to an item indicating that the complexity of an item is probably between a DOK level 1 and a DOK level 2 or between a DOK level 2 and a DOK level 3. However, if some panelists are assigning a DOK level 1 (recall or recognition in mathematics) to an item while others are assigning a DOK level 3 (strategic thinking) to the same item then this difference requires discussion. After discussing these items, panel members may change their item codes, but it is not necessary to change if they feel strongly that their original judgments were correct. The adjudication process could reveal a more appropriate objective/element/skill for an item than the panelist initially selected, or it could reveal that the panelist made an error in recording his or her coding for an item.

Reports should be reviewed to determine discrepancies between the replicate panels. This review should begin only after both groups have completely finished coding the assessment items to the assessment framework and after the adjudication process. The summary reports for each of the four alignment criteria should be used to determine if the two groups are in agreement. Under Categorical Concurrence, the average number of items assigned to each content area for mathematics and aspects of reading by text type for reading should be reviewed. Under the Depth-of-Knowledge Consistency, the average percentage of items for each content area that were below the DOK level of the assigned objective/element/skill, at the DOK level, or above the DOK level should be reviewed. Under Range-of-Knowledge Correspondence, the percentage of objectives/elements/skills that had at least one corresponding item should be reviewed.

For Balance of Representation, any index value lower than .7 should be reviewed because an index value below .7 would indicate that the majority of items were coded to only one or two objectives. The balance-of-representation criterion is used to indicate the extent to which one "knowledge" expectation is given more emphasis on the assessment than another. This index only considers the "knowledge" expectations for a standard that has at least one hit—i.e., one related assessment item per expectation. The index is computed by considering the difference in the proportion of expectations and the proportion of hits assigned to each expectation. An index value of 1 signifies perfect balance and is obtained if the hits (corresponding items) related to a standard are equally distributed among the expectations for the given standard. Index values that approach 0 signify that a large proportion of the hits are accounted for by only one or two of the expectations. If most items relate to one expectation and only one or a few items relate to the remaining expectations, this would be described as a unimodal distribution and the index value would be less than 0.5. A bimodal distribution would have an index value of around 0.55 or 0.6. Index values of 0.7 or higher indicate a relatively even distribution of items across all of the expectations. An index value of 0.7 or higher is recommended as the target criterion for balanceof-representation. Index values between 0.6 and 0.7 indicate the balance-of-representation criterion has only been "weakly" met.

Any differences between the two groups of panelists of more than five percentage points, should be investigated further. This criterion has emerged from numerous studies as a good indicator of the level of agreement, or lack thereof, which signals the need for further evaluation and explanation. If the results are within these margins, the results for the two groups will be deemed to replicate judgments. If the differences are greater, the standard agreement tables and the item agreement tables should be examined to identify the group differences in the mapping of

items to the objectives/elements/skills. The group facilitators should first try to resolve any large discrepancies by reviewing documentation of panelists' opinions collected throughout the process. Facilitators will identify areas of disagreement to be discussed by the combined group of panel members for the subject. If the discussion does not lead to common agreement between groups, the differences will be resolved by the two group facilitators.

<u>Task 11 Map Two Forms of the Pexam to the NAEP Framework:</u> The same procedures should be followed in mapping items from the Pexam to the NAEP assessment framework as were followed for Task 8 (mapping the NAEP assessment to the NAEP assessment framework).

<u>Task 12 Panel Members Respond to a De-Briefing Questionnaire:</u> Panel members should individually respond to a small set of questions after the Pexam items have been coded to the NAEP framework (see Task 9).

<u>Task 13 Facilitators Determine Discrepancies and Panelists Adjudicate:</u> See Task 10 for a description of identification of discrepancies between panelists in coding Pexam items to NAEP framework and of panelists' participation in a discussion and adjudication process.

<u>NAEP Framework:</u> The mapping of the assessment items to the NAEP assessment framework will conclude with panelists individually responding to debriefing questions regarding each assessment. Questionnaires will be constructed to elicit responses to these questions, as well as to document the level of understanding, confidence, and comfort with which panelists performed the tasks. Panel members should respond to questions regarding the following aspects of the alignment of items to the NAEP framework. Additional questions may be recommended.

- (a) What were major differences between the two assessments in item types, content coverage, and complexity of items relative to the NAEP framework?
- (b) Based on the content analysis completed for the NAEP framework, what similarities and differences are expected in the content knowledge of students who perform well on each assessment, who perform moderately, and who perform poorly?
- (c) What similarities and differences were identified between the two assessments?

Tasks 15 Assign DOK levels to Pexam Assessment Framework Expectations: Tasks 7-14 involve panelists mapping the item pools of the two assessments to the NAEP framework. Beginning with Task 15, panelists are repeating the same tasks with the Pexam framework. The tasks for this alignment can vary by major content topics included, the structure of the content, the level of specificity (grain size), and the type of performance expressed. Mapping the Pexam items and the 2009 NAEP item pool to the Pexam assessment framework will produce another view of the alignment between the two assessments. Each assessment framework is a representation of a domain of knowledge. The extent to which the mappings of two or more assessments to a common domain of knowledge are similar will help to determine the degree of alignment. Mapping the NAEP and the Pexam items directly to the framework of each assessment will reveal similarities and differences in the DOK levels of items in relationship to the framework, range, and balance as described in the section above on determining the degree of alignment using the four alignment criteria. The bi-directional alignment design maximizes

information regarding the alignment between two assessments, i.e., the degree and nature of both overlap and non-overlap between the two assessments.

The consensus process used by panelists to assign DOK levels to the NAEP assessment frameworks will be used in coding items to the Pexam assessment framework. It is likely that the Pexam assessment frameworks will not have the same level of detail as the NAEP assessment framework, so the amount of time required for this part of the process will be different. Reaching consensus on the DOK levels of objectives is still important to facilitate discussion of the framework's objectives.

Task 23 Analysis of Alignment Data: After the content alignment panels have completed their work, data should be analyzed to describe the proportion of the objectives in each the NAEP and Pexam assessment frameworks by DOK levels. The two frameworks should be compared on the proportion of objectives distributed across the different levels of complexity. This comparison should be made for each content area and general topic underlying a content area. The data on the DOK levels of the objectives in the two assessment frameworks should be interpreted in the context of the comparative content analysis of the two frameworks and test blueprints completed in Task 4. In the comparative content analysis (Task 4), an expert is to produce information on the alignment of two assessments, based on the framework documents and test specifications. The data collected from the content alignment panelists will produce information based on the actual assessment items. The analysis in Task 4 is at a higher level and reflects the "intended" assessment, whereas the analysis by alignment panelists is at a more detailed level and reflects the "actual" assessment—how the framework was operationalized by the pool of assessment items.

It is possible that items match a sub-area of an assessment framework but not the next more detailed level of organization called for by the framework, such as an "objective." In that case, a "generic objective" is identified for coding the item within a specific sub-area. If two or more panel members assigned an item to a generic objective (i.e. subtopic or content area for mathematics NAEP and text feature or literary type for reading NAEP), the items should be listed for evaluation. Generic objectives indicate the absence of complete alignment. A large number of items mapped to a generic objective indicates holes in the assessment framework—an issue of granularity for which the items only target the general ideas expressed by the framework area and not the explicit content described by the objectives. To the extent possible, such gaps should be identified in advance by the alignment contractor so that discussions can be conducted on site with panelists regarding these items and potential gaps.

Data must be recorded for each panel member to report the number of items coded to each objective/element/skill under a content area. Data analyses should include computations of averages for the different alignment criteria across panelists including the number of items assigned to an objective/element/skill and the DOK level of the item in relationship to the DOK level of the assigned objective/element/skill. Data recorded by individual panelists are averaged across panel members to produce the average number of items coded to an objective/element/skill. The variables to be computed include:

- Categorical Concurrence:
- Frequency of items by:

Content area

Subtopics/reading text features and literary types

Objectives/element/skill

Other content area

- Depth-of-Knowledge Consistency
- Frequency of items by DOK level within:

Content area

Subtopics/aspects/context

Objectives/elements/skills

- Range-of-Knowledge Correspondence
- Percentage of objectives/elements/skills under a content area with one or more items
- Balance of Representation
- Balance index value for each content area

The values of each of these variables should be compared between the two assessments as mapped to the NAEP assessment framework and the two assessments as mapped to the Pexam assessment framework. The software analysis package (e.g. WAT) should be used to produce a cross-study data table that creates a table with items from each assessment mapped to the same objectives/elements/skills. The information recorded in the cross-study tables can be used to compare the distribution of items by objective for the two assessments (Exhibit 4). The example illustrated in Exhibit 4 shows that the two forms are very comparable on the Categorical Concurrence alignment criterion for Standard M.S.6.1 because the total number of items on each form assigned to each objective is very similar (only varies by one item for each objective).

| | Group | NAEP | | | | Pexam | | | | | |
|-----------|-----------|----------------------|--------|--------|----------------------|-------|--------|--------|--------|--------|--|
| | DOK | | | | | | | | | | |
| Objective | Consensus | Item ID (Freq Coded) | | | Item ID (Freq Coded) | | | | | | |
| M.S.6.1 | 2 | | | | | | | | | | |
| M.S.6.1 | 2 | | | | | | | | | | |
| M.O.6.1.1 | 1 | | | | | | | | | | |
| M.O.6.1.2 | 2 | 8-(6) | 9-(3) | 40-(6) | | | 39-(6) | 41-(3) | | | |
| M.O.6.1.3 | 1 | | | | | | | | | | |
| M.O.6.1.4 | 3 | 13-(2) | 22-(6) | 39-(6) | 41-(2) | | 15-(4) | 17-(4) | 32-(6) | 38-(6) | |
| M.O.6.1.5 | 2 | 19-(6) | | | | | 26-(5) | 35-(6) | | | |
| M.O.6.1.6 | 1 | 6-(5) | 27-(4) | | | | 2-(6) | 31-(6) | | | |
| M.O.6.1.7 | 2 | 28-(6) | 33-(5) | 37-(6) | 43-(6) | | 1-(3) | 20-(6) | 42-(4) | | |

Exhibit 4: Sample cross-study table produced by WAT contrasting items from NAEP and Pexam mapped to the same objective by number of panelists (given in the parentheses).

Additional data analyses should be produced that show for each item on each assessment analyzed the objective/element/skill as mapped by each panelist. These data should be used to determine the consistency among panelists in mapping an item to an objective/element/skill and

the number of objectives to which each item was mapped. These data should be used to assess the breadth in content targeted by specific items (items assigned to multiple objectives/elements/skills) and the level of interrater agreement in assigning an item to objectives/elements/skills. Given appropriate training and understanding on the part of the panelists, a lack of agreement is most likely due to overlapping objectives/elements/skills in the assessment framework and/or more robust items that provide students an opportunity to apply a number of different approaches to answering the item correctly. Panel members' notes on specific items are used to identify the source of low interrater agreement, if that is revealed.

Information from the framework content analysis should be used to describe the format of each assessment to provide a context for the analytic data generated from the analysis of the assessments by the panels. For example, the item formats used in each assessment should be described. This discussion should include the number and proportion of items included on an assessment that targeted specific content areas. If items have different score points, the comparison should be weighted to reflect this fact. For example, constructed response items in NAEP typically have a higher number of possible points than multiple choice items. Information that should be reported includes, but is not limited to, the following.

- Item format
 - o Proportion of multiple-choice
 - o Proportion of constructed response
 - o Proportion of extended response
- Item context
 - o Passage characteristics

Alignment Determination

The content alignment between the NAEP assessment and another assessment should be established by comparing the values under the different alignment criteria for each of the assessments. These data will be presented to the Governing Board for use in evaluating and reporting results of other studies in the 12th grade preparedness research program. Working with technical experts, the Board will determine quantitative criteria to be applied to the results for determining the extent to which two assessments are aligned. Values to be considered in determining the extent to which two assessments are aligned include:

- (a) The number and proportion of items that map to each content area
- (b) The DOK levels of the items within each content area
- (c) The proportion of objectives under a content area targeted by items
- (d) The relative emphasis to subtopics and objectives under a content area
- (e) The structure of knowledge represented in the assessment framework for each assessment as indicated by the format of items, the item context, and other test characteristics

All of these factors need to be considered together and reported to determine the *degree* of alignment. Of course, some factors are more important than others, and the relative weights to assign to these factors will need to be determined by the Board.

Panelists

A replication of the alignment, two groups conducting the alignment concurrently, is required to strengthen the confidence in the findings. Porter, et al (2008) report that five raters provide the requisite level of reliability in a content alignment study. For the NAEP studies, however, two groups of six -eight content experts each are recommended for each subject. (The recommendation is that 8 panelists be recruited for each replicate panel to help ensure that a minimum of 6 panel members are available in the event of last-minute attrition.) As discussed above, the two groups will conduct the analysis simultaneously so that results can be compared and differences adjudicated on site. Conducting such a replication at two separate times would likely produce some variation in results, most likely at the item level rather than with the alignment criteria. The timing logistics would then make it difficult to determine the reasons for these variations. Further, previous experience indicates that panelists develop decision rules for their coding when faced with assessment frameworks that have over lapping objectives or when the objectives in an assessment framework lack clarity. These issues increase the importance of holding replicate panels simultaneously; having two groups independently, but at the same time, conduct the analysis will help reveal such decision rules and determine how these rules impact the results. To the extent possible, potential ambiguity will be identified in advance and panelists will be trained to code items in a consistent way. However, strict decision rules should be avoided as these may discourage the use of panelist expertise.

The experts for a content area who will serve as panel members should be selected because of their deep knowledge of the subject matter (mathematics or reading) and experience in analyzing curricula and assessments. Caution must be exerted in selecting persons for the panel to assure there is no bias with regard to any one of the assessments to be analyzed. Fifty to sixty percent of the panelists (in each of the two replicate panels) should come from post-secondary activities relevant to the Pexam (e.g. mathematicians, mathematics educators, language arts professors, and reading educators). Examples of individuals from the secondary education sector to serve as panelists include curriculum coordinators, content area assessment specialists, state content consultants, and high school teachers in the subject area. Intimate knowledge of each assessment should be equally represented by panelists on each panel. Individuals who have participated in other alignment studies are eligible to serve on these panels. Persons who are employed by commercial testing companies are not eligible to serve as panelists. Geographic regions and racial-ethnic groups should be represented proportionally to assure diversity of the group of panelists. Content expertise and knowledge, however, should be the primary criterion for selection of panelists.

Quality Control

Having two groups of panelists conduct the alignment analysis simultaneously for each subject will provide evidence of the reliability of the findings and increase confidence in the final results. The two groups should be trained together so the training is standardized, but the alignment analyses should be conducted independently.

As mentioned earlier, two forms of each Pexam assessment and the entire 2009 NAEP item pool for each subject should be analyzed. It is assumed that the Pexam assessment forms are parallel with very little variation in the distribution of items among content topics and by item format. Forms of the Pexam can be analyzed for comparability so that the forms selected for use in the alignment analysis are similar. The difference in the number of items between the 12th grade NAEP (approximately 200 for mathematics) and a form of the Pexam (probably less than 100 items) is not critical in determining the alignment between the two assessments because results are primarily reported by proportion of items on the assessment. When the two forms are analyzed, four panelists should start analyzing one form first with the other panelists starting with the other form so that the two forms are reviewed in a different sequence.

Timeline for Conducting the Alignment Analysis

The estimated time required for conducting the alignment analysis from the approval of the proposal to submitting the final report is seven months. This time span could be compressed if some of the preparation tasks are implemented concurrently. The alignment study, data analysis, and report writing will require about three months to complete. Careful review of the report is important, and ample time must be allotted for this part of the process.

The major tasks and the estimated time for each task are listed below. Time estimates are stated as the duration needed to complete a task. Some tasks can be accomplished simultaneously.

- 1. Set time, location, and venue for the analysis (4 weeks)
- 2. Identify group facilitators and panelists (4 weeks)
- 3. Identify materials and equipment needed for the analysis (2 weeks)
- 4. Enter NAEP framework into analysis software (1 week)
- 5. Print and compile materials needed for coding (3 days)
- 6. Alignment Study (1 week)
- 7. Analyze data by tabulating variables for alignment criteria and comparing values between tests (2 weeks)
- 8. Incorporate qualitative information on tests and NAEP (2 weeks)
- 9. Draft report (2 weeks)
- 10. Review report (4 weeks)
- 11. Final report (4 weeks)

Logistics for the Study

The facility selected for the study must accommodate the use of a computer with appropriate network and/or internet access for each panel member. A general session room will also be required along with one additional break out room for one of the replication panels. A room set classroom style for ease of computer use is recommended for the panelists. An additional room to store materials and to conduct analyses of results, review questionnaires, and so forth is recommended.

The process and analysis will be greatly facilitated if software specifically designed for conducting alignment studies is used, such as the Web Alignment Tool (WAT). The WAT can be used by panelists to enter data and by staff for analyzing data and producing data tables. The computers should be hard-wired to a server rather than using a wireless. Most conference hotels can accommodate the requirements for this sort of study.

The Governing Board staff will acquire secure materials for NAEP and the other test programs and facilitate acquisition of other necessary assessment materials for the study. The alignment study contractor will be responsible for identifying necessary materials and for maintaining the security of all test materials.

Process Leadership

One person, the project director, should have ultimate responsibility for conducting the alignment study and exercising leadership on site. This person should be identified by the alignment contractor and serve as the primary contact person for Governing Board staff. The project director should be responsible for identifying the specific procedures to be used and should have overall responsibility for assuring that all tasks are completed on time and according to the agreed-upon study design. The project director should be responsible for overseeing the data analysis and report writing and for the production of all contract deliverables associated with the content alignment study.

The alignment contractor should clearly identify the staffing requirements for the project and who will be responsible for conducting each of the tasks. At a minimum the project director should be assisted by two subject matter group facilitators for each of mathematics and reading. One of the subject matter group facilitators should have responsibility for training all of the panelists in the content group together. There will be a facilitator for each alignment panel group when the replicate groups are formed.

The group facilitators will need to be content experts who are well versed in the alignment analysis process. The group facilitators should be experienced in training panelists in the alignment methodology and facilitating the alignment process.

Reliability, Panelist Agreement, and Replication of Results

Panelists will engage in two major judgments when coding items to an assessment framework: the assignment of a DOK level to a test item and the assignment of an item to an objective(s) under the assessment framework. For both of these judgments, consistency among panelists is critical to meaningful findings. An average measure intraclass correlation (Shrout and Fleiss, 1979) should be used as one measure of the panelists' agreement in assigning DOK levels to items. The average DOK level assigned to an item by the panelists should be used as one of the variables in the analysis. The pairwise comparison is a more stringent statistic and should also be used. If variance in assigning DOK levels to items among panelists is low, then computation of the intraclass correlation is inappropriate. The pairwise comparison provides a more meaningful

measure of agreement in this case. Pairwise comparisons can also be used as one measure to judge the agreement among panelists in assigning items to objectives, elements, subtopics, and the content area.

Alignment judgments by panelists will not be in complete agreement, and several sources of variance should be analyzed. The effectiveness of the training, the composition of the alignment panel, the depth of discussion among the panelists, and the sequential order of aligning different forms of assessments can all generate variations in the final results and impact the apparent degree of alignment between two tests. Conducting a replication study will add confidence to the findings, identify information that is consistent across the groups, and identify inconsistencies across groups and studies. The most rigorous replication study design would require a second panel to independently conduct the analysis in its entirety. The recommended design using concurrent replicate panels allows adjudication of differences through discussion between members of the two panels. If the variation between the two panels appears to be random and minor, then the results from the two panels can be averaged or aggregated.

Materials

Materials from different sources are required for the study. Copies for each panelist, for group facilitators, and for observers will be needed.

Required NAEP Materials

Assessment frameworks and test specifications for reading and mathematics

NAEP 12th grade item pool for each subject

Scoring guides and scoring rubrics for each item

Anchor papers to represent each score point for each constructed response item

Point value assigned to each item

Required Pexam Materials

Test blueprints

Test objectives

Two test forms of each test to be analyzed

Scoring guide and scoring rubrics for each item

Anchor papers to represent each score point for each constructed-response item

Point value assigned to each item

Additional Materials

Training materials (DOK definitions, illustrative items)

Software for data entry and analysis

Presentation materials

Evaluation forms

Computers, printers, photocopiers

Evaluations by Panelists

Panelists will be given evaluation questions after the training, after major tasks, and at the end of the study. The questionnaires will include both structured response items (Likert-type scales) and open-ended questions. These questions will focus on panelists' evaluation of the following aspects of the study:

- 1. Training and instructions
- 2. Materials, both advanced and on site
- 3. The alignment process, including the qualifications of panelists, composition of panels, alignment criteria, coding of items, quality and quantity of information provided, and adjudication procedures
- 4. Procedures for data communications, especially the ease of using the software
- 5. Logistics, including meeting facilities, agenda, travel arrangements

Evaluation questions after the training include:

- 1. How well do you feel the training prepared you to apply the Depth of Knowledge Levels?
- 2. How well do you feel the training prepared you for the adjudication process?
- 3. Overall, how well did the training prepare you for the alignment process?

Evaluation questions to be answered at the end of the study:

- 1. How well did the process capture the content similarities of the assessments?
- 2. How well did the process capture the content differences between the assessments?
- 3. To what degree was the pair of assessments aligned?
- 4. Considering the items in each assessment, how did the assessments differ and how were they the same?

Reports

An interim report is to be presented regarding the expert comparison of the two assessment frameworks conducted as Task 4. This report should present the results of the evaluation and specify how the information will be used to structure the data entry and reporting software, to identify and eliminate ambiguous objectives or other framework aspects, to train panelists for coding items, and to report results of the alignment study. Any other aspects of the alignment study that should be addressed must be identified in this report. An overall evaluation of the alignment of the two assessments, based on the comparative analysis of frameworks, should be stated.

A comprehensive report is to be prepared to describe the methodology used and the results of the alignment between each NAEP assessment and the Pexam assessment. The methodology section of the report is to describe the qualifications of the group facilitators and panelists, the structure of the assessment framework used in the analyses, the training of panelists, the alignment criteria used in the analysis, and the coding procedures. The comparative analysis of the assessment frameworks for the assessments should provide the context for reporting the findings on the alignment between the assessments. The results section will summarize the DOK levels assigned

to the objectives of the assessment framework, the description of the results of mapping each test to the assessment framework, the degree of alignment between each NAEP subject item pool and each Pexam. The conclusions will delineate the parts of the two assessments that are aligned and the parts that are not aligned. Within each category, variability in level of alignment and non-alignment should be identified.. An Executive Summary will present the major points and conclusions from the report. Data tables produced from the analysis are to be included as appendices to the report.

Appendix A Example of Agenda

Day 1: Training in General Session

- 1. Introductions and administrative details (one hour)
- 2. Training (5 hours)
 - a. Purpose and importance of the study
 - b. Overview of the process
 - c. Training in specific tasks
- 3. Instructions for log in to the WAT or other software for this purpose (one hour)
- 4. Evaluation of training (.25 hours)

Day 2: (Parallel Replicate Panel Groups

- 1. Code DOK levels of NAEP framework (2-3 hours)
- 2. Map NAEP items to NAEP framework (4-5 hours)
- 3. Break (Facilitators check item coding and identify discrepancies for discussion and adjudication process)
- 4. Adjudicate coding of NAEP items to NAEP framework (1 hour)
- 5. Evaluation of NAEP items-to-NAEP framework coding (.25 hour)
- 6. Evaluation of process and understanding of procedures (.25 hour)

Day 3:

- 1. Map Pexam Form 1 to NAEP framework (2.5 hours)
- 2. Map Pexam Form 2 to NAEP framework (2.5 hours)
- 3. Break (Facilitators check item coding and identify discrepancies for discussion and adjudication process)
- 4. Adjudicate coding of Pexam items to NAEP framework (1 hour)
- 5. Evaluation of Pexam items-to-NAEP framework coding (.25 hour)
- 6. Evaluation of process and understanding of procedures (.25 hour)

Day 4:

- 1. Code DOK levels of Pexam framework (2-3 hours)
- 2. Map Pexam Form 1 to Pexam framework (2.5 hours)
- 3. Map Pexam Form 2 to Pexam framework (2.5 hours)
- 4. Break (Facilitators check item coding and identify discrepancies for discussion and adjudication process)
- 5. Adjudicate coding of Pexam items to Pexam framework (1 hour)
- 6. Evaluation of Pexam items-to-Pexam framework coding (.25 hour)
- 7. Evaluation of process and understanding of procedures (.25 hour)

Day 5:

- 1. Map NAEP assessment items to Pexam framework (4-5 hours)
- 2. Break (Facilitators check item coding and identify discrepancies for discussion and adjudication process)

- 3. Adjudicate coding of NAEP items to Pexam framework (1 hour)
- 4. Evaluation of NAEP items-to-Pexam framework coding (.25 hour)
- 5. Evaluation of process and understanding of procedures (.25 hour)
- 6. Overall debriefing (1 hour0
- 7. 1.5 hours debriefing across assessments
- 8. Evaluation of overall alignment process, evidence generated, criteria applied, and holistic conclusion regarding alignment of the assessments; recommendations regarding alignment and appropriate uses of evidence; evaluation of process and understanding of procedures (.5 hour)

Appendix B

Depth-of-Knowledge Definitions for Mathematics²

Level 1 (Recall) includes the recall of information such as a fact, definition, term, or a simple procedure, as well as performing a simple algorithm or applying a formula. That is, in mathematics, a one-step, well defined, and straight algorithmic procedure should be included at this lowest level. Other key words that signify Level 1 include "identify," "recall," "recognize," "use," and "measure." Verbs such as "describe" and "explain" could be classified at different levels, depending on what is to be described and explained.

Level 2 (Skill/Concept) includes the engagement of some mental processing beyond a habitual response. A Level 2 assessment item requires students to make some decisions as to how to approach the problem or activity, whereas Level 1 requires students to demonstrate a rote response, perform a well-known algorithm, follow a set procedure (like a recipe), or perform a clearly defined series of steps. Keywords that generally distinguish a Level 2 item include "classify," "organize," "estimate," "make observations," "collect and display data," and "compare data." These actions imply more than one step. For example, to compare data requires first identifying characteristics of the objects or phenomenon and then grouping or ordering the objects. Some action verbs, such as "explain," "describe," or "interpret," could be classified at different levels depending on the object of the action. For example, interpreting information from a simple graph, or requiring mathematics information from the graph, also is at Level 2. Interpreting information from a complex graph that requires some decisions on what features of the graph need to be considered and how information from the graph can be aggregated is at Level 3. Level 2 activities are not limited solely to number skills, but can involve visualization skills and probability skills. Other Level 2 activities include noticing and describing non-trivial patterns; explaining the purpose and use of experimental procedures; carrying out experimental procedures; making observations and collecting data; classifying, organizing, and comparing data; and organizing and displaying data in tables, graphs, and charts.

Level 3 (Strategic Thinking) requires reasoning, planning, using evidence, and a higher level of thinking than the previous two levels. In most instances, requiring students to explain their thinking is at Level 3. Activities that require students to make conjectures are also at this level. The cognitive demands at Level 3 are complex and abstract. The complexity does not result from the fact that there are multiple answers, a possibility for both Levels 1 and 2, but because the task requires more demanding reasoning. An activity, however, that has more than one possible answer and requires students to justify the response they give would most likely be at Level 3. Other Level 3 activities include drawing conclusions from observations; citing evidence and

² Mr. Webb has used the DOK definitions for conducting alignment studies, and he judged the definitions to be applicable to an alignment study with NAEP assessments. The definitions shall be used as described; however, recommendations may be made for approval of changes to the definitions in cases where this is necessitated by virtue of the content of the Pexam.

developing a logical argument for concepts; explaining phenomena in terms of concepts; and using concepts to solve problems.

Level 4 (Extended Thinking) requires complex reasoning, planning, developing, and thinking, most likely over an extended period of time. The extended time period is not a distinguishing factor if the required work is only repetitive and does not require applying significant conceptual understanding and higher-order thinking. For example, if a student has to take the water temperature from a river each day for a month and then construct a graph, this would be classified as Level 2. However, if the student is to conduct a river study that requires taking into consideration a number of variables, this would be at Level 4. At Level 4, the cognitive demands of the task should be high and the work should be very complex. Students should be required to make several connections—relate ideas within the content area or among content areas—and to select one approach among many alternatives on how the situation should be solved, in order to be at this highest level. Level 4 activities include developing and proving conjectures; designing and conducting experiments; making connections between a finding and related concepts and phenomena; combining and synthesizing ideas into new concepts; and critiquing experimental designs.

Appendix C

Depth-of-Knowledge Definitions for Reading³

Reading Level 1. Level 1 requires students to receive or recite facts or to use simple skills or abilities. Oral reading that does not include analysis of the text, as well as basic comprehension of a text, is included. Items require only a shallow understanding of the text presented and often consist of verbatim recall from text, slight paraphrasing of specific details from the text, or simple understanding of a single word or phrase. Some examples that represent, but do not constitute all of, Level 1 performance are:

Support ideas by reference to verbatim or only slightly paraphrased details from the text. Use a dictionary to find the meanings of words. Recognize figurative language in a reading passage.

Reading Level 2. Level 2 includes the engagement of some mental processing beyond recalling or reproducing a response; it requires both comprehension and subsequent processing of text or portions of text. Inter-sentence analysis of inference is required. Some important concepts are covered, but not in a complex way. Standards and items at this level may include words such as summarize, interpret, infer, classify, organize, collect, display, compare, and determine whether fact or opinion. Literal main ideas are stressed. A Level 2 assessment item may require students to apply skills and concepts that are covered in Level 1. However, items require closer understanding of text, possibly through the item's paraphrasing of both the question and the answer. Some examples that represent, but do not constitute all of, Level 2 performance are:

Use context cues to identify the meaning of unfamiliar words, phrases, and expressions that could otherwise have multiple meanings.

Predict a logical outcome based on information in a reading selection. Identify and summarize the major events in a narrative.

Reading Level 3. Deep knowledge becomes a greater focus at Level 3. Students are encouraged to go beyond the text; however, they are still required to show understanding of the ideas in the text. Students may be encouraged to explain, generalize, or connect ideas. Standards and items at Level 3 involve reasoning and planning. Students must be able to support their thinking. Items may involve abstract theme identification, inference across an entire passage, or students' application of prior knowledge. Items may also involve more superficial connections between texts. Some examples that represent, but do not constitute all of, Level 3 performance are:

³ As for mathematics, the DOK levels for reading describe levels of content complexity that can be used for analyzing the NAEP and other reading assessments. The reading levels are based on Valencia and Wixson (2000, pp. 909-935). The definitions shall be used as described; however, recommendations may be made for approval of changes to the definitions in cases where this is necessitated by virtue of the content of the Pexam.

Explain or recognize how the author's purpose affects the interpretation of a reading selection. Summarize information from multiple sources to address a specific topic. Analyze and describe the characteristics of various types of literature.

Reading Level 4. Higher-order thinking is central and knowledge is deep at Level 4. The standard or assessment item at this level will probably be an extended activity, with extended time provided for completing it. The extended time period is not a distinguishing factor if the required work is only repetitive and does not require the application of significant conceptual understanding and higher-order thinking. Students take information from at least one passage of a text and are asked to apply this information to a new task. They may also be asked to develop hypotheses and perform complex analyses of the connections among texts. Some examples that represent, but do not constitute all of, Level 4 performance are:

Analyze and synthesize information from multiple sources. Examine and explain alternative perspectives across a variety of sources. Describe and illustrate how common themes are found across texts from different cultures.

Appendix D

Example Comparing a NAEP Mathematics Subdomain with a Standard from Another Test

| NAEP Mathematics | Test A Mathematics | Similarities and Differences |
|---|---|--|
| Number Properties and | | |
| Operations | | |
| 1) Number Sense | N. NUMBER SENSE | Test A: Number sense is one of five standards. NAEP: it is subtopic under one of five content areas. |
| | N.1. Analyze the structural characteristics of the real number system and its various subsystems. Analyze the concept of value, magnitude, and relative magnitude of real numbers. | |
| d) Represent, interpret, or compare expressions for real numbers, including expressions using exponents and logarithms. | N.1.1. Students are able to represent numbers in a variety of forms and identify the subsets of rational numbers. Exponents Scientific notation Absolute value Radicals (perfect squares) Graph on a number line | Both frameworks state students are to represent real numbers using exponents. NAEP only includes logarithms. Test A explicitly states radicals and number line graphs. |
| f) Represent or interpret expressions involving very large or very small numbers in scientific notation. | | NAEP incorporated in Test A N.1.1. |
| g) Represent, interpret, or compare expressions or problem situations involving absolute values. | N. 2. Apply number operations with real numbers and other number systems. | Test A explicitly states absolute value as a form to be represented. NAEP expects specific applications of absolute value in problem situations |
| | N.2.1. Students are able to read, write, and compute within any subset of rational numbers. Solve problems involving discount, markup, commission, profit, and simple interest. | NAEP more explicitly uses computation with real numbers under subtopic number operations. |
| i) Order or compare real numbers, including very large or small real numbers. | | |

Appendix E

The following chart includes some steps that have been useful in previous alignment studies to facilitate the consensus process.

| Facili | itating the Consensus Process |
|--------|--|
| 1. | Read each objective aloud before discussing it. |
| 2. | As you go through the objectives, actively solicit comments from all panel members. Pay special attention to making sure that each panel member feels involved. (Not every panelist needs to address every objective, but make sure that everyone is included in the process.) |
| 3. | Use the print-out to call on people who coded DOK levels differently from the coding of other members of the group, and ask them to explain why they coded the objective to the particular DOK level. Be sure they use the DOK definitions to justify their answers. |
| 4. | Once two panel members have described how they have coded an objective differently, ask a third panel member to highlight the differences between these two interpretations. |
| 5. | Restate and summarize points of agreement and disagreement among panelists to determine if your interpretation is accurate. |
| 6. | If there is a difference in interpretation of the objective's <i>terminology</i> or <i>expectations</i> , discuss alternatives by asking for volunteers with direct experience in applying an objective. |
| 7. | Provide an opportunity for panelists to change their codes after the discussion. |
| 8. | If panelists remain divided on the DOK level of an objective, focus attention on the most likely skills or content knowledge required in the objective, not the more extreme possibilities the objective might allow. |
| 9. | The facilitator should not dominate the consensus process. Even if the facilitator has strong feelings about the DOK level of an objective, it is important to have panel members raise the points and reach agreement on level. |

I. Introduction

The purpose of this report is to analyze the similarities and differences between the Grade 8 NAEP Reading Framework (NAGB, 2010) and the reading ACT College Readiness Standards (CRS) for the EXPLORE test that were originally published in 2005 (ACT, Inc., 2009). Documents used for the analysis are versions published before changes for the 2014-15 administrations of the tests. The analysis includes a short description of key features of each test followed by a crosswalk to highlight similarities and differences across the two frameworks that might impact the types and content of items on the tests.

Neither NAEP Reading nor ACT EXPLORE Reading are guided by a traditional set of standards or objectives, although both provide generalized statements about what students at different performance levels are likely to be able to do based on data from students' performance at these levels. NAEP calls these generalizations "achievement levels" and EXPLORE refers to these generalizations as College Readiness Standards (CRS). These generalizations serve as the primary data used in the side-by-side comparison appended at the end of this report, although information from other parts of the assessment documents was also used. As a result of the lack of more traditional standards, this comparison does not lend itself to a quantitative analysis more typical in "alignment" studies. Consequently, this analysis is more qualitative in nature with a goal of describing the similarities and differences between these two assessments in terms of their perspectives on reading, cognitive demands, reading passages, and item characteristics as determined using a range of available materials including the 2013 NAEP Reading Framework and 2011 Your Guide to EXPLORE.

The CONNECT booklet from ACT, Inc., includes *Ideas for Progress* (ACT, Inc., 2009, pp. 8-13) in conjunction with each score range within each strand. The *Ideas for Progress* describe to teachers learning experiences that could benefit students at a score range. These ideas clarify and add detail to what the standards mean and help for designing lesson plans. The *Ideas for Progress* for reading helped translate the standards statements for application for teaching. The standards themselves were judged to sufficiently communicate what skills and knowledge students should demonstrate for a score range. The reading analysis was done by using only the standard statements (ACT, Inc., 2009; 2011).

II. ACT EXPLORE

ACT, Inc., does not publish a test development blueprint or framework, but rather provides a set of College Readiness Standards (CRS) that are grouped by score ranges. The standards were derived from actual test takers, using EXPLORE (the test for 8th and 9th graders) normative data along with PLAN data (the test for 10th graders) and ACT data (the college admission test for 11th and 12th graders). Scores from the EXPLORE were to be used by students in 8th and 9th grades to devise a plan to reach post-high school goals. According to EXPLORE/ACT documents (ACT, Inc., 2009, 2011, 2013), ACT analyzed these normative data along with college admission criteria and information about actual college course placement to describe the skills and knowledge needed to achieve each score range. The score-range standards were based on items that 80 percent of the students answered correctly who scored within that range. Thus, the standards for a score range describe the skills and knowledge that students in that range demonstrated. For example, 80 percent of students in the score range of 20-23 were able to "infer the main idea or purpose of straight-forward paragraphs in uncomplicated literary narratives" (Std MID 301 in the numbering system used in this report). The standards are cumulative: a student scoring 17 is likely able to do all the work described in the 16-19 score-range as well as all standards below that score range (13-15). No standards are provided for scores below 13. The reading standards are grouped under five strands:

Main Ideas and Author's Approach (MID)

Supporting Details (SUP)

Sequential, Comparative, and Cause-Effect Relationships (REL)

Meanings of Words (MOW)

Generalizations and Conclusions (GEN)

Scores from the EXPLORE and the PLAN are placed on a common scale. EXPLORE scores range from 1-25; PLAN from 1-32. Consequently, the scores on both the EXPLORE and PLAN were reviewed "side-by-side" to develop the score ranges. The scores on the ACT test range from 1-36 as an extension of the scale used for EXPLORE and PLAN. The ACT test scores are used by the ACT Course Placement Service to provide colleges and universities with cut-off scores to place students in courses. These cut-off scores also were used to develop the score ranges for the CRS. ACT, Inc., documents emphasize that the EXPLORE and PLAN are curriculum-based tests derived from what is actually taught in schools.

EXPLORE CRS consist of 39 standards across the five strands, divided into four score ranges, from 13-25. ACT, Inc., documents state that although the strands overlap, each standard has been assigned to a primary strand. Documents also point out that "lack of a CRS statement in a score range indicates that there was insufficient evidence with which to determine a descriptor" (ACT, Inc., 2009, p. 7).

The EXPLORE Reading Test was designed to simulate the types of reading tasks students come upon both within and out of school. The Reading Test "measures students' literal-level reading skills as well as

their ability to make inferences, draw conclusions, generalize from specific data, and reason logically" (ACT, Inc., 2009, p. 14). The test had three reading passages with ten multiple-choice items for each.

Reading skills were assessed in three content areas: prose fiction, humanities, and social science. The three content areas are described in more detail in Table 1.

Table 1: EXPLORE Reading Test Content Areas and Percentage of Items

30 questions, 30 minutes, 3 passages (500 words each)

| Content Area | Description of Passages | % of Test |
|----------------|--|-----------|
| Prose Fiction | The test questions in this category are based on passages from short stories or novels | 33.3 |
| Humanities | The test questions in this category are based on passages from memoirs and personal essays, and in the content areas of architectures, art, dance, ethics, film, language, literary criticism, music, philosophy, radio, television, or theater. | 33.3 |
| Social Science | The test questions in this category are based on passages in anthropology, archaeology, biography, business, economics, education, geography, history, political science, psychology, or sociology. | 33.3 |

(From EXPLORE, Connecting College Readiness Standards to the Classroom, For Language Arts Teachers/ Reading. 2009, ACT, Inc., p. 14).

The EXPLORE Reading Tests items were classified in the referring and reasoning areas. Referring questions ask about materials explicitly stated in a passage and are designed to measure literal reading understanding. Reasoning questions ask about "meaning implicit in a passage and require cogent reasoning about a passage" (ACT, Inc., 2009, p. 15).

The EXPLORE Reading Tests consisted of 30 items drawn from a larger pool, and was taken in 30 minutes. EXPLORE is a domain-sampled test with forms created by sampling from the reading domain. Equivalence of forms is achieved both by meeting multiple constraints on the number of items in each content area, the cognitive scope of the items, and match to a difficulty distribution in addition, as well as through fine-tuning using equivalent-population equating. The Reading test was administered along with the English, Mathematics, and Science tests. The complete test took 2.5 hours and was usually administered in one sitting. The test was given year round, at the discretion of the district/school. There was no penalty for answering incorrectly, and the test was not speeded. That is, most students finished in the allocated time.

III. NAEP

The 2013 grade 8 NAEP reading test included 163 items divided among 19 passages, two general types of texts, three levels of complexity, and three item designs. Of the 19 passages and corresponding items,

seven were administered only on the grade 8 assessment, eight were administered on both the grade 4 and grade 8 assessments, and four were administered on both the grade 8 and grade 12 assessments.

According to the NAEP framework, 45 percent of the passages on the grade 8 assessment were to be literary and 55 percent of the passages were to be informational (NAGB, 2012, p. 11). The passages were selected to represent the type of texts students would experience both within and out of school.

Students were assessed on meaning vocabulary (NAGB, 2012, p. 12) and comprehension. Throughout the NAEP reading assessment students were expected to draw on their vocabulary knowledge. Gaining the meaning of most words used in a paragraph or passage was viewed as a necessary condition for comprehension. Each passage was expected to have approximately two items on vocabulary. These words were to be linked to the central ideas of the passage. A student's understanding of the meaning of these words was to be assessed in the context of the passage. Students were not to be asked to draw upon prior knowledge of the definition of a word by selecting or producing such a definition. The vocabulary items could be multiple choice or short, constructed-response in format.

The NAEP reading assessment is administered every other year (odd years) to 8th graders. It is administered between January and March to a stratified national probability sample. Schools are sampled by region and students are sampled within school. Samples are drawn for both public and non-public schools. In 2013, 171,800 8th graders from 6,510 schools took the reading test (National Center for Education Statistics, 2014, p. 3). Students were given 50 minutes to complete the reading assessment which included two 25-minute blocks of items. Blocks differed from booklet to booklet. One block generally consisted of one passage and its items. The number of items for a passage ranged from five to 11.

IV. Perspectives on Reading

The EXPLORE Reading assessment focuses on the "complex of complementary and mutually supportive skills that readers must bring to bear in studying written materials across a range of subject areas" (ACT, Inc., 2011, p. 10).

The NAEP Reading Framework is guided by a definition of reading that applies to the assessment of reading achievement. This definition states that "reading is an active, complex process that involves: understanding written text, developing and interpreting meaning, and using meaning as appropriate to type of text, purpose, and situation" (NAGB, 2012, p. 2).

Definitional Similarities/Differences — The main difference in the perspectives on reading taken by these two assessments is the attention to subject areas in EXPLORE in contrast to the emphasis in NAEP on the processes associated with different aspects of comprehension appropriate for a range of text types, purposes, and situations.

V. Cognitive Demands

The EXPLORE Reading assessment emphasized two types of cognitive demands in its item development (1) referring to what is explicitly stated, and (2) reasoning to determine implicit meanings and to draw conclusions, comparisons, and generalizations. Referring cognitive skills were measured in the EXPLORE Reading by items that required the student to (1) recognize the explicitly stated main idea of a passage or of a paragraph; (2) recognize explicitly stated significant details (the who, what, where, when, why, and how information); and (3) recognize explicitly stated relationships, such as sequence, cause- effect, and comparison. Reasoning cognitive skills were measured in the EXPLORE Reading assessment by items that required the student to (1) infer main ideas or purposes, sequences, cause effect relationships, and relationships between details and the main idea; (2) demonstrate critical understanding of the text by drawing conclusions from facts given; making comparisons using information in the passage; making appropriate generalizations; recognizing logical fallacies, rhetorical flaws, or limitations in passages (e.g., details that undermine the main idea); recognizing stereotypes; understanding point of view; and distinguishing between fact and opinion; and (3) determine specific meanings of words or short phrases within the context of a passage.

The 2013 NAEP Reading Framework and Item Specifications focused on three types of *cognitive targets* to reflect the mental processes or kinds of thinking that underlie reading comprehension. The three categories of cognitive targets used for NAEP item development were: (1) <u>Locate and recall</u> information from text, (2) <u>Integrate and interpret</u> information and ideas presented in text, and (3) <u>Critique and evaluate</u> information and ideas in text and the ways in which authors present text. The NAEP Framework provided a matrix that illustrated the types of processing that should be addressed in item development for all three categories of cognitive demand according to genre (literary and informational text). The NAEP Framework considered vocabulary items to fall into the cognitive realm of integrate/interpret, which is similar to EXPLORE considering vocabulary within the definition of "reasoning" items.

Similarities/Differences in Cognitive Demands — There is a great deal of overlap between the reasoning and referring processes examined by EXPLORE and the locate/recall and integrate/interpret processes evaluated by NAEP. The most significant difference lies in the NAEP Critique/Evaluate items, which

require readers "to stand back from what they read and view the text objectively. The focus remains on the text itself but the reader's purpose is to consider the text critically by assessing it from numerous perspectives and synthesizing what is read with other texts and other experiences" (NAGB, 2012, p. 38). ACT EXPLORE did include items representing some of the critique/evaluate cognitive processes under reasoning cognitive skills, but no mention was found in the available documentation for synthesizing what is read with other texts or experiences.

VI. Reading Passages

Genre/Domain

The EXPLORE Reading assessment is comprised of three prose passages that are representative of the level and kinds of writing commonly encountered in secondary curricula—i.e. passages on topics in prose fiction, the humanities, and the social sciences are included as follows:

- Prose Fiction. Intact short stories or excerpts from short stories or novels.
- Humanities. Passages from memoirs and personal essays and in the content areas of architecture, art, dance, ethics, film, language, literary criticism, music, philosophy, radio, television, and theater.
- Social Sciences. Anthropology, archaeology, biography, business, economics, education, geography, history, political science, psychology, sociology.

The NAEP Reading Framework divides texts into two categories—Literary and Informational. At grade 8, the NAEP Framework specifies that 45 percent of the texts should be literary and 55 percent should be informational (NAGB, 2012, p. 11). Literary texts are defined in terms of the subgenre of fiction, literary non-fiction (e.g., essays, speeches, biographies), and poetry. Informational texts are specified in terms of the subgenre of exposition, argumentation and persuasive text, and procedural texts and documents. The NAEP Framework also provides multiple examples of the types of texts that will be sampled at each grade level within each of the specified subgenre. It is important to note that some NAEP passages are used in assessing both grade 4 and grade 8 and other passages are used assessing both grade 8 and grade 12. Thus, the text complexity of some passages on the grade 8 NAEP for reading are not necessarily targeted for just that grade level. Based on the assessment documentation for each assessment, passages on the EXPLORE are characterized as being uncomplicated and challenging, while the passages used in the grade 8 NAEP reading assessment are described as having a range of difficulty deemed appropriate for grade 8 by multiple indices evaluated by expert reviewers.

Text Length & Characteristics

The EXPLORE texts are approximately 500 words in length, and are selected from published sources. Each passage is preceded by a heading that identifies what type of passage it is (e.g., "Prose Fiction"), names the author, and may give a brief note that helps in understanding the passage.

In terms of text characteristics, from the information available EXPLORE provides descriptions of "uncomplicated" and "more challenging" literary and informational passages. Uncomplicated literary passages refer to excerpts from essays, short stories, and novels that tend to use simple language and structure, have a clear purpose and a familiar style, present straightforward interactions between characters, and employ only a limited number of literary devices such as metaphor, simile, or hyperbole. More challenging literary passages refer to excerpts from essays, short stories, and novels that tend to make moderate use of figurative language; have a more intricate structure and messages conveyed with some subtlety; and may feature somewhat complex interactions between characters. Uncomplicated informational passages refer to materials that tend to contain a limited amount of data, address basic concepts using familiar language and conventional organizational patterns, have a clear purpose, and are written to be accessible. More challenging informational passages refers to materials that tend to present concepts that are not always stated explicitly and that are accompanied or illustrated by more—and more detailed—supporting data, include some difficult context-dependent words, and are written in a somewhat more demanding and less accessible style.

The NAEP Reading Framework specifies that texts at grade 8 are to be between 400 and 1,000 words in length, although the average passage length is well above 500 words. NAEP also specifies that..."most material included on the assessment will be presented in its entirety as students would encounter it in their own reading. However, some materials may be excerpted, for example, from a novel or a long essay. Excerpted material is to be carefully analyzed to ensure that it is coherent in structure"...(p. 28, 2013 NAEP Reading Framework).

The NAEP Framework provides highly detailed specifications of the text structures and features, as well as the dimensions of "author's craft" for each of the subgenre specified within the literary and informational types of text. These specifications are intended to describe the types of texts that will be sampled, along with the text structures and literacy devices or elements of author's craft about which items may be developed.

The NAEP Item Specifications (NAGB, 2009) provide detailed information about the criteria used for text selection. This document indicates that expert judgment is the primary method for evaluating and

selecting passages for inclusion on the assessment and that at least two research-based readability formulas also are used to gather additional information about passage difficulty. In addition, it specifies that stimulus material must be well written, interesting to read, and "considerate," and must come from authentic sources such as those students would encounter in their in-school and out-of-school reading. It also notes that in the selection of informational text, the degree of content elaboration will be an important criterion for passage selection. Sufficient elaboration of new concepts is needed if students are to gain sufficient information to respond to questions. Tersely written informational text tends to be more difficult for students to comprehend than text written with more elaborated explanations. (The question of) ... "whether text is tersely written or presents fully elaborated content is particularly important with topics that may be beyond the background knowledge of some students".. (NAGB, 2009, p. 17).

Passage Similarities/Differences—NAEP passages are selected primarily according to genre (literary vs. informational as defined above) rather than disciplinary considerations. In contrast, the selection of EXPLORE passages is driven more by disciplinary considerations (Prose Fiction, Humanities, and Social Sciences). Using the NAEP definitions of literary and informational passages, the prose fiction passages on the EXPLORE are considered literary. The social sciences passages on the EXPLORE are considered informational. The humanities passages, however, could be either literary (e.g. memoirs and personal essays) or informational (e.g. expository or argumentative pieces on topics from architecture, art, dance, ethics, film, language, literary criticism, etc.). The NAEP 2013 Reading Framework (NAGB, 2012, page 11) indicates that the distribution of passages on the grade 8 assessment should be 45 percent literary passages and 55 percent informational passages. The EXPLORE may include either 33 percent or 67 percent of the passages as literary. Given that the subgenre described by the two assessments within each category of text overlap greatly, it is unlikely that there is any significant difference between the two assessments in terms of genre covered (although NAEP does include poetry and embedded document texts such as charts, but EXPLORE does not). The most significant differences are: a) longer, more intact texts in NAEP as opposed to shorter excerpts in EXPLORE, b) the attention to specified disciplinary content in EXPLORE, which is not present in NAEP, and c) the presence of paired passages in NAEP, but not in EXPLORE. ACT characterized the passages on the EXPLORE as being uncomplicated or challenging (ACT, Inc., 2009). The 2013 NAEP Reading Framework described the passages used in the grade 8 NAEP for reading as having a range of difficulty deemed appropriate for grade 8 by multiple indices evaluated by expert reviewers (NAGB, 2012, p. 30).

VII. Item Characteristics

All of the 30 items on the EXPLORE Reading assessment are multiple-choice items—10 items for each of the three passages. Each passage is accompanied by both referring and reasoning items. The proportion of each type of item depends on the nature of the passage and the cognitive demands it places on the reader.

The grade 8 NAEP Reading assessment had a total of 163 items. Based on the framework these items were to be distributed by time to be 40 percent multiple-choice, 45 percent short constructed response (can be answered by one or two phrases or sentences), and 15 percent extended constructed response (which require a response in "a paragraph or two"). The number of items of each type associated with each reading block (one or two passages) at grade 8 ranges from 3-5 multiple-choice, 5-8 short constructed response, with a single extended constructed response, for a total of 10-12 items per block. Each student reads two blocks. In addition, the distribution of items for the grade 8 NAEP Reading assessment was to be 20 percent Locate/Recall, 50 percent Integrate/Interpret, and 30 percent Critique/Evaluate.

Item Similarities/Differences. Both assessments require students to respond to approximately 10 items per passage. However, all of the EXPLORE items were multiple-choice, whereas 60 percent of the items by time on NAEP at grade 8 were to be constructed response.

VIII. Summary

Based on the comparison above and the side-by-side table (Appendix), there are many similarities between the 2013 grade 8 NAEP Reading assessment and the 2013 ACT EXPLORE Reading assessment. One notable difference is that about 60 percent of the 39 behaviors on the EXPLORE Reading (i.e. based on the ACT College Readiness Standards) include "uncomplicated" texts. The NAEP statement of behaviors does not specify passages by complexity.

Other differences worth noting include the following: a) greater attention to subject matter in the selection of texts in EXPLORE than in NAEP, b) EXPLORE is entirely multiple-choice, where NAEP is 60 percent constructed response at Grade 8, c) NAEP includes some text types that are not included on EXPLORE (e.g., poetry and embedded documents such as charts), and d) NAEP measures "cross text" comprehension, but EXPLORE does not. In sum, the demands of the 2013 Grade 8 NAEP Reading assessment appear to be at least as rigorous, if not greater, than those of the ACT EXPLORE Reading

assessment. EXPLORE does include items similar to the Critique/Evaluate items in NAEP, though, which comprise 30 percent of NAEP items at Grade 8 (ACT 2013). The EXPLORE includes assessment items used in measuring reasoning cognitive skills that require the student to demonstrate critical understanding of the text (ACT, Inc., 2011, p. 10). The 2013 NAEP Reading Framework specified that the NAEP reading assessment for Grade 8 should comprise of 30 percent of Critique/Evaluate items (NAGB, 2012, p. 41).

The side-by-side analysis was originally done using all score ranges for the ACT EXPLORE CRS. There is overlap among the benchmarks for the different score ranges. Most of the expectations listed under the NAEP cognitive targets were found to correspond to a standard under the CRS. Some of the cognitive targets at the Critique/Evaluate level related to argumentative text did not correspond to a CRS benchmark. These are listed at the end of the side-by-side chart. Although, precise corresponding statements of behaviors were not found between the CRS and the NAEP listing of cognitive targets and achievement levels, ACT, Inc., staff indicated that in fact the EXPLORE does include assessment items that do correspond to the Critique/Evaluate cognitive targets. One main difference between the two documents is that the analysis between texts shown for NAEP is not mentioned in the ACT CRS.

Another important note is that the cognitive targets matrix for NAEP was used more as a guide than a blue print for item writing. "The cognitive targets matrix is for illustrative purposes only and should not be considered an exhaustive list" (NAGB, 2012, p. 39, Footnote 5). As a consequence there are many NAEP items that cannot be easily slotted into a specific "objective" as defined by the cognitive target matrix or that can apply equally to many of the "objectives" derived from the cognitive targets. This can result in significant problems in determining whether the NAEP items actually reflect the framework—let alone whether the EXPLORE items map to the NAEP framework. The NAEP achievement levels descriptions were also included in the analysis between the two frameworks. The achievement levels included some statements of what skills and knowledge students should have in addition to those listed under the cognitive targets.

The achievement levels are statements of "how good is good enough" (NAGB, 2012, page 43-44). The achievement levels were developed preliminarily as a whole to help guide the item writers. Then the achievement levels were refined based on the achievement level setting process. Items were reviewed to determine the cut score for each of the achievement levels. After the cut scores were determined, exemplar items were chosen to clarify each of the three performance levels. Some achievement levels were represented by a very small number of items that actually appeared on the assessment. Because the achievement levels descriptions have corresponding items—albeit a subset of those on the test—they

provide a glimpse into how the cognitive targets matrix was interpreted by the item writers. To address these nuances in the assessment items comprehensively, information from both the cognitive targets and the achievement levels descriptions were used to represent the content of the framework.

Appendix A. Side by Side Comparison Table: NAEP – ACT CRS

Objective Level NAEP Grade 8 Reading Comparison to ACT College and Career Readiness Standards Content Comparison*

| ACT College Readiness Standards EXPLORE (Benchmarks 13-25) | NAEP Grade 8 Achievement Definitions and Cognitive Targets | Similarities and Differences |
|---|---|---|
| Main Ideas and Author's Approach (MID) | | |
| MID 201. Recognize a clear intent of an author or narrator in uncomplicated literary narratives | | NAEP Cog Targets (informational text only) |
| MID 301. Identify a clear main idea or purpose of straightforward paragraphs in uncomplicated literary narratives | Cog Targets Identify textually explicit information within and across texts, such as: Topic sentence or main idea; Author's purpose; Causal relations; or Locate specific information in text or graphics for informational text. Text Ref¹: Structural organization (e.g. main idea) and elements will be assessed at increasingly level of complexity. (p. 24) BAch Def²—"able to locate information; identify statements of main idea, theme, or author's purpose" | NAEP Cog Targets (informational text only), but included under the Basic Achievement level definition. The EXPLORE restricts the expectation to paragraphs, whereas the NAEP does not. |
| MID 401. Infer the main idea or purpose of straightforward paragraphs in uncomplicated literary narratives | Cog Targets—Integrate ideas to determine theme in literary texts. BAch Def—"able to make simple inferences from texts" PAch Def³—"able to provide relevant information and summarize main ideas and themes" | These are similar "behaviors." If there's a difference it's that EXPLORE restricts the behavior to "straightforward paragraphs in uncomplicated" texts but NAEP does not. |
| MID 402. Understand the overall approach taken by an author or narrator (e.g., point of view, kinds of evidence used) in uncomplicated passages | Cog Target—Judge author's craft and technique and evaluate author's perspective or point of view in both literary and informational texts; and analyze the presentation of information in informational text. PAch Def—"able to fully substantiate judgments aboutpresentation of content" | These are focused on similar areas. However, EXPLORE focuses on "understanding" in uncomplicated passages, where NAEP expects students to make and substantiate judgments, and does not limit this to uncomplicated passages. |

¹ Text Ref Refers to a reference from the text of the *Reading Framework for the 2013 National Assessment of Educational Progress* (NAGB, 2012).

² BAch Def NAEP Reading Basic Achievement Level Definition (NAGB, 2012, Appendix B, pp. 64-65).

³ PAch Def NAEP Reading Proficient Achievement Level Definition (NAGB, 2012, Appendix B, p. 65).

| ACT College Readiness Standards EXPLORE (Benchmarks 13-25) | NAEP Grade 8 Achievement Definitions and Cognitive Targets | Similarities and Differences |
|--|--|--|
| MID 501. Identify a clear main idea or purpose of any paragraph or paragraphs in uncomplicated passages | Cog TargetsIdentify textually explicit information within and across texts, such as topic sentence or main idea; author's purpose for informational text. BAch Def—"able to identify statements of main idea, theme, or author's purpose" | CRS refers to uncomplicated passages whereas NAEP is specific to informational texts in general. |
| MID 502. Infer the main idea or purpose of straightforward paragraphs in more challenging passages | Cog Targets—Identify textually explicit information within and across texts, such as topic sentence or main idea; author's purpose for informational text. PAch Def—"able to provide relevant information and summarize main ideas and themes; able to make and support inferences about a text" | CRS is for more complicated passages whereas NAEP is specific to informational texts in general. |
| MID 503. Summarize basic events and ideas in more challenging passages | Cog Targets—Make complex inferences within and across texts to summarize major ideas for informational text. PAch Def—"able to connect parts of a text" | CRS is for more challenging passages whereas NAEP is for informational texts in general. |
| MID 504. Understand the overall approach taken by an author or narrator (e.g., point of view, kinds of evidence used) in more challenging passages | Cog Targets—Consider text(s) critically to judge author's craft and technique; evaluate the author's perspective or point of view within or across texts in both literary and informational text. PAch Def—"able to fully substantiate judgments about content and presentation of content" | |
| Supporting Details (SUP) | | |
| SUP 201. Locate basic facts (e.g., names, dates, events) clearly stated in a passage | Cog Targets—Identify textually explicit information and make simple inferences within and across texts, such as facts in both literary and information text. BAch Def—"able to locate information; able to locate and provide relevant facts to construct general statements about information from the text" | |
| SUP 301. Locate simple details at the sentence and paragraph level in uncomplicated passages | Cog Targets—Identify textually explicit information and make simple inferences within and across texts, such as supporting details in both literary and information text. Cog Targets—Identify textually explicit information within and across texts, such as locate specific information in text or graphics. BAch Def—"able to locate information; able to locate and provide relevant facts to construct general statements about information from the text" | |
| SUP 302. Recognize a clear function of a part of an uncomplicated passage | | |

| ACT College Readiness Standards EXPLORE (Benchmarks 13-25) | NAEP Grade 8 Achievement Definitions and Cognitive Targets | Similarities and Differences |
|---|--|--|
| SUP 401. Locate important details in uncomplicated passages | Cog Target—Identify textually explicit info and make simple inferences within and across texts, such as supporting details in literary and informational text. PAch Def—"able to locate and provide facts and relevant information that support a main idea" in informational text | These are similar "behaviors." If there's a difference, it's that EXPLORE restricts the behavior to uncomplicated text, but NAEP does not (and even allows that it might occur across texts) |
| SUP 402. Make simple inferences about how details are used in passages | Cog Target—Evaluate the strength and quality of evidence used by author to support his or her position in informational text. PAch Def—"make and support inferences about a text, (and) connect text parts" | Although not exactly the same, these "behaviors" seem to cover similar ground |
| SUP 501. Locate important details in more challenging passages | Cog Target—Make complex inferences within and across texts to determine the importance of information within and across texts for informational text. AAch Def ⁴ —"able to state and justify statements about text features, choice of content, and the author's use of evidence and rhetorical devices" | |
| ACT College Readiness Standards EXPLORE (Benchmarks 13-25) | NAEP Grade 8 Achievement Definitions and Cognitive Targets | Similarities and Differences |
| SUP 502. Locate and interpret minor or subtly stated details in uncomplicated passages | Cog Target—Make complex inferences within and across texts to determine the importance of information within and across texts for informational text. AAch Def—"able to state and justify statements about text features, choice of content, and the author's use of evidence and rhetorical devices" | |
| SUP 503. Discern which details, though they may appear in different sections throughout a passage, support important points in more challenging passages | Cog Target—Identify textually explicit information and make simple inferences within and across texts, such as supporting details in both literary and information text. PAch Def—"able to make and support inferences about a text, connect parts of a text, and analyze text features" | |
| Sequential, Comparative, and Cause-Effect Relationships (REL) | | |
| REL 201. Determine when (e.g., first, last, before, after) or if an event occurred in uncomplicated passages | Cog Target—Identify textually explicit information within and across texts, such as sequence of events or actions in literary text. | |

⁴ AAch Def NAEP Reading Advanced Achievement Level Definition (NAGB, 2012, Appendix B, p. 65).

| ACT College Readiness Standards EXPLORE (Benchmarks 13-25) | NAEP Grade 8 Achievement Definitions and Cognitive Targets | Similarities and Differences |
|--|--|---|
| REL 202. Recognize clear cause-effect relationships described within a single sentence in a passage | Cog Target—Identify textually explicit information within and across texts, such as causal relations in information text. | |
| REL 301. Identify relationships between main characters in uncomplicated literary narratives | Cog Target—Make complex inferences within and across texts to identify or interpret a character's motivations and decisions in literary text. | |
| | Cog Target—Consider text critically to evaluate a character's motivations and decisions in literary text. PAch Def—"able to make and support a connection between characters from two parts of a text" | |
| REL 302. Recognize clear cause-effect relationships within a single paragraph in uncomplicated literary narratives | Cog Target—Identify textually explicit information within and across texts, such as causal relations in information text. PAch Def—"interpret causal relationships" | |
| REL 401. Order simple sequences of events in uncomplicated literary narratives | Cog Target—Identify textually explicit information within and across texts, such as sequence of events or actions in literary text. | These are similar "behaviors." Possible differences are that EXPLORE specifies "order" in contrast to NAEP's "identify", and NAEP allows that this behavior might occur across texts. |
| REL 402. Identify clear relationships between people, ideas, and so on in uncomplicated passages | Cog Target—Examine relations btw theme and setting or characters in literary texts. PAch Def—"recognize character actions and infer and support character feelings" and "provide and support judgments about character motivation across texts" and "make and support a connection between characters from two parts of a (literary) text" in literary text | These are similar "behaviors." One possible difference is that these behaviors are limited to literary text in NAEP, but no such restriction is present in EXPLORE |
| REL 403. Identify clear cause-effect relationships in uncomplicated passages | Cog Target—Describe problem and solution or cause and effect in literary and informational texts. PAch Def—"interpret causal relations" in informational text | These are similar "behaviors." Possible differences are that NAEP specifies "interpret" in contrast to EXPLORE's "identify" and EXPLORE specifies uncomplicated passages, which NAEP does not |
| REL 501. Order sequences of events in uncomplicated passages | Cog Target—Identify textually explicit information within and across texts, such as sequence of events or actions in literary text. | |
| REL 502. Understand relationships between people, ideas, and so on in uncomplicated passages | Cog Target—Make complex inferences within and across texts to examine relations between theme and setting or characters in literary text. AAch Def—"able to make connections within and across texts" | |

| ACT College Readiness Standards EXPLORE (Benchmarks 13-25) | NAEP Grade 8 Achievement Definitions and Cognitive Targets | Similarities and Differences |
|---|---|--|
| REL 503. Identify clear relationships between characters, ideas, and so on in more challenging literary narratives | Cog Targets—Make complex inferences within and across texts to compare or connect ideas, problems, or situations in both literary and informational text. AAch Def—"able to make connections within and across texts" | |
| REL 504. Understand implied or subtly stated cause- effect relationships in uncomplicated passages | Cog Target—Make complex inferences within and across texts to describe problem and solution or cause and effect in both literary and informational text. PAch Def—"interpret causal relations" AAch Def—"able to explain causal relations" | |
| REL 505. Identify clear cause-effect relationships in more challenging passages | Cog Target—Identify textually explicit information within and across texts, such as causal relations" in informational text. | |
| Meanings of Words (MOW) | | |
| MOW 201. Understand the implication of a familiar word or phrase and of simple descriptive language | Cog Target— Identify textually explicit information and make simple inferences within and across texts, such as: Definitions, Facts, or Supporting details for both literary and informational texts. BAch Def—"able to interpret the meaning of a word as it is used in the text" | Understanding the implication of a familiar work or phrase is considered similar to what is meant by NAEP's making simple inferences about text. |
| MOW 301. Use context to understand basic figurative language | Cog Target—Identify textually explicit information within and across texts, such as identify figurative language in literary text. BAch Def—"able to interpret the meaning of a word as it is used in the text" | |
| MOW 401. Use context to determine the appropriate meaning of some figurative and nonfigurative words, phrases, and statements in uncomplicated passages | Cog Target—Identify textually explicit information within and across texts, such as identify figurative language in literary text. PAch Def—"identify how figurative language is used" in literary texts and "recognize rhetorical devices" in informational texts | These are similar "behaviors", although EXPLORE specifies uncomplicated passages while NAEP does not. The CRS expectation is much broader, but if more language from NAEP relative to its emphasis on vocabulary was included, then the two would be comparable. |
| MOW 501. Use context to determine the appropriate meaning of virtually any word, phrase, or statement in uncomplicated passages | Text Ref: The Governing Board has endorsed the idea of measuring students' vocabulary as part of the reading assessment and supports an approach that assesses vocabulary in the context of the reading passages. (p. 12) BAch Def—"able to interpret the meaning of a word as it is used in the text" | |

| ACT College Readiness Standards EXPLORE (Benchmarks 13-25) | NAEP Grade 8 Achievement Definitions and Cognitive Targets | Similarities and Differences |
|--|---|---|
| MOW 502. Use context to determine the appropriate meaning of some figurative and nonfigurative words, phrases, and statements in more challenging passages | Text Ref: The Governing Board has endorsed the idea of measuring students' vocabulary as part of the reading assessment and supports an approach that assesses vocabulary in the context of the reading passages. (p. 12) BAch Def—"able to interpret the meaning of a word as it is used in the text" | |
| Generalizations and Conclusions (GEN) | | |
| GEN 201. Draw simple generalizations and conclusions about the main characters in uncomplicated literary narratives | Cog Target—Consider text(s) critically to evaluate a character's motivations and decisions in literary text. PAch Def—"able to provide and support judgments about character motivation across texts" | Behaviors for both assessments target attention to characters. It is not clear if the type of conclusions expressed by the CRS includes evaluating a character's motivations and decisions. |
| GEN 301. Draw simple generalizations and conclusions about people, ideas, and so on in uncomplicated passages | Cog Target—Make complex inferences within and across texts to examine relations between theme and setting or characters in literary text. | |
| GEN 401. Draw generalizations and conclusions about people, ideas, and so on in uncomplicated passages | Cog Target—Draw conclusions and provide supporting information in informational text; Identify or interpret character's motivations & decisions in literary text. | These "behaviors" are closely related, however, NAEP adds the element of providing supporting information and does not limit the behavior to uncomplicated passages |
| GEN 402. Draw simple generalizations and conclusions using details that support the main points of more challenging passages | Cog Target——Draw conclusions and provide supporting information and find evidence in support of an argument in informational texts; compare or connect ideas, problems, or situations in literary and informational text. | These "behaviors" are not exactly the same, but do encompass similar abilities. |
| GEN 501. Draw subtle generalizations and conclusions about characters, ideas, and so on in uncomplicated literary narratives | Cog Target -Make complex inferences within and across texts to identify or interpret a character's motivations and decisions in literary text. | CRS is only within texts. |
| GEN 502. Draw generalizations and conclusions about people, ideas, and so on in more challenging passages | Cog Target -Make complex inferences within and across texts to identify or interpret a character's motivations and decisions in literary text. | CRS is only within texts and is more general to include people in general and ideas. |
| | Cog Target—Consider text(s) critically to judge the coherence, logic, or credibility of an argument in informational text. PAch Def—"provide and support a judgment about the author's argument or stance" in informational text | This behavior reflects a dimension of NAEP that is not explicitly specified in EXPLORE—the inclusion of argumentative text, and critique/evaluate questions |
| | Cog Target—Identify textually explicit information within and across texts, such as: character traits in literary text. | CRS SUP 301 and 401 specify locating details without explicitly stating "character traits." |

| ACT College Readiness Standards EXPLORE (Benchmarks 13-25) | NAEP Grade 8 Achievement Definitions and Cognitive Targets | Similarities and Differences |
|--|---|----------------------------------|
| | Cog Target—Identify textually explicit information within and across texts, such as: located specific information in text or graphics in informational text. | |
| | Cog Target—Make complex inferences within and across texts to: determine unstated assumptions in an argument; describe how an author uses literary devices and text features in literary and informational text. | |
| | Cog Target—Make complex inferences within and across texts to: infer mood or tone; explain how rhythm, rhyme, or form in poetry contribute to meaning in literary text. | EXPLORE has corresponding items. |
| | Cog Target—Make complex inferences within and across texts to: distinguish facts from opinion in informational text. | EXPLORE has corresponding items |
| | Cog Target—Consider text(s) critically to: take different perspectives in relation to a text in literary and informational text. | EXPLORE has corresponding items |
| | Cog Target—Consider text(s) critically to: evaluate the role of literary devices in conveying meaning; determine the degree to which literary devices enhance a literary work; analyze the point of view used by the author in literary text. | EXPLORE has corresponding items |
| | Cog Target—Consider text(s) critically to: evaluate the way the author selects language to influence readers; determine the quality of counterarguments within and across texts in informational text. | |

^{*} The primary sources of information used to complete the Side-by-Side Table are the EXPLORE College Readiness Standards for students scoring at Benchmarks 13-25, and the NAEP Achievement Level Descriptions for students scoring as Basic, Proficient, or Advanced at Grade 8. Additional information for the NAEP column comes from the Cognitive Targets Matrix.

Addendum

Post-CAI Addendum: NAEP- EXPLORE Reading Framework Analysis

Following the completion of the Content Alignment Institute (CAI) on February 9-13, 2015, several clarification comments were received from ACT staff about the side-by-side chart comparing the College Readiness Standards (CRS) for reading to the 2013 Grade 8 NAEP Reading Framework. Objectives with a clarification are listed below.

Appendix A: Side by Side Comparison Table: NAEP – ACT CRS

(Revisions suggested by review comments of ACT staff)

| ACT College Readiness Standards EXPLORE (Benchmarks 13-25) | NAEP Grade 8 Achievement Definitions and Cognitive Targets | Similarities and Differences |
|---|--|---|
| Main Ideas and Author's Approach (MID) | | |
| MID 201. Recognize a clear intent of an author or narrator in uncomplicated literary narratives | | NAEP Cog Targets (informational text only) |
| MID 301. Identify a clear main idea or purpose of straightforward paragraphs in uncomplicated literary narratives | idea, theme, or author's purpose" | NAEP Cog Targets (informational text only), but included under the Basic Achievement level definition. |
| MID 401. Infer the main idea or purpose of straightforward paragraphs in uncomplicated literary narratives | DAGI Del— able to make simple intererices from texts | These are similar "behaviors." If there's a difference it's that EXPLORE restricts the behavior to "straightforward paragraphs in uncomplicated" texts but NAEP does not. |

⁵ BAch Def NAEP Reading Basic Achievement Level Definition (NAGB, 2012, Appendix B, pp. 64-65).

⁶ PAch Def NAEP Reading Proficient Achievement Level Definition (NAGB, 2012, Appendix B, p. 65).

| ACT College Readiness Standards EXPLORE (Benchmarks 13-25) | NAEP Grade 8 Achievement Definitions and Cognitive Targets | Similarities and Differences |
|--|---|--|
| MID 402. Understand the overall approach taken by an author or narrator (e.g., point of view, kinds of evidence used) in uncomplicated passages | Cog Target—Judge author's craft and technique and evaluate author's perspective or point of view in both literary and informational texts; and analyze the presentation of information in informational text PAch Def—"able to fully substantiate judgments aboutpresentation of content" | These are focused on similar areas. EXPLORE focuses on "understanding" in uncomplicated passages, where NAEP expects students to make and substantiate judgments, and does not limit this to uncomplicated passages. In addition, CRS SUP 504 supports "Locate or interpret minor or subtly stated in more challenging passages" |
| MID 501. Identify a clear main idea or purpose of any paragraph or paragraphs in uncomplicated passages | Cog Targets—Identify textually explicit information within and across texts, such as topic sentence or main idea; author's purpose for informational text. BAch Def—"able to identify statements of main idea, theme, or author's purpose" | CRS refers to uncomplicated passages whereas NAEP is specific to informational texts in general. |
| MID 502. Infer the main idea or purpose of straightforward paragraphs in more challenging passages | Cog Targets—Identify textually explicit information within and across texts, such as topic sentence or main idea; author's purpose for informational text. PAch Def—"able to provide relevant information and summarize main ideas and themes; able to make and support inferences about a text" | CRS is for more complicated passages whereas NAEP is specific to informational texts in general. |
| MID 503. Summarize basic events and ideas in more challenging passages | Cog Targets—Make complex inferences within and across texts to summarize major ideas for informational text PAch Def—"able to connect parts of a text" | CRS is for more challenging passages whereas NAEP is for informational texts in general. |
| MID 504. Understand the overall approach taken by an author or narrator (e.g., point of view, kinds of evidence used) in more challenging passages | Cog Targets—Consider text(s) critically to judge author's craft and technique; evaluate the author's perspective or point of view within or across texts in both literary and informational text PAch Def—"able to fully substantiate judgments about content and presentation of content" | |
| Supporting Details (SUP) | | |
| SUP 201. Locate basic facts (e.g., names, dates, events) clearly stated in a passage | Cog Targets—Identify textually explicit information and make simple inferences within and across texts, such as facts in both literary and information text BAch Def—"able to locate information; able to locate and provide relevant facts to construct general statements about information from the text" | Similarly CRS supports "Make simple inferences about how details are used in passages" (SUP 402) |

| ACT College Readiness Standards EXPLORE (Benchmarks 13-25) | NAEP Grade 8 Achievement Definitions and Cognitive Targets | Similarities and Differences |
|---|---|--|
| SUP 301. Locate simple details at the sentence and paragraph level in uncomplicated passages | Cog Targets—Identify textually explicit information and make simple inferences within and across texts, such as supporting details in both literary and information text Cog Targets—Identify textually explicit information within and across texts, such as locate specific information in text or graphics. BAch Def—"able to locate information; able to locate and provide relevant facts to construct general statements about information from the text" | |
| SUP 302. Recognize a clear function of a part of an uncomplicated passage | | |
| SUP 401. Locate important details in uncomplicated passages | Cog Target—Identify textually explicit info and make simple inferences within and across texts, such as supporting details in literary and informational texts PAch Def—"able to locate and provide facts and relevant information that support a main idea" in informational text | These are similar "behaviors." If there's a difference, it's that EXPLORE restricts the behavior to uncomplicated text, but NAEP does not (and even allows that it might occur across texts) |
| SUP 402. Make simple inferences about how details are used in passages | Cog Target—Evaluate the strength and quality of evidence used by author to support his or her position in informational text PAch Def—"make and support inferences about a text, (and) connect text parts" | Although not exactly the same, these "behaviors" seem to cover similar ground |
| SUP 501. Locate important details in more challenging passages | Cog Target—Make complex inferences within and across texts to determine the importance of information within and across texts for informational text AAch Def—"able to state and justify statements about text features, choice of content, and the author's use of evidence and rhetorical devices" | |
| SUP 502. Locate and interpret minor or subtly stated details in uncomplicated passages | AAch Def ⁷ —"able to state and justify statements about text features, choice of content, and the author's use of evidence and rhetorical devices" | |
| SUP 503. Discern which details, though they may appear in different sections throughout a passage, support important points in more challenging passages | Cog Target—Identify textually explicit information and make simple inferences within and across texts, such as supporting details in both literary and information text PAch Def—"able to make and support inferences about a text, connect parts of a text, and analyze text features" | |
| Sequential, Comparative, and Cause-Effect Relationships (REL) | | |

.

⁷ AAch Def NAEP Reading Advanced Achievement Level Definition (NAGB, 2012, Appendix B, p. 65).

| ACT College Readiness Standards EXPLORE (Benchmarks 13-25) | NAEP Grade 8 Achievement Definitions and Cognitive Targets | Similarities and Differences |
|--|--|---|
| REL 201. Determine when (e.g., first, last, before, after) or if an event occurred in uncomplicated passages | Cog Target—Identify textually explicit information within and across texts, such as sequence of events or actions in literary text | |
| REL 202. Recognize clear cause-effect relationships described within a single sentence in a passage | Cog Target—Identify textually explicit information within and across texts, such as causal relations in information text | |
| REL 301. Identify relationships between main characters in uncomplicated literary narratives | PAch Def—"able to make and support a connection between characters from two parts of a text" | |
| REL 302. Recognize clear cause-effect relationships within a single paragraph in uncomplicated literary narratives | Cog Target—Identify textually explicit information within and across texts, such as causal relations in information text PAch Def—"interpret causal relationships" | |
| REL 401. Order simple sequences of events in uncomplicated literary narratives | Cog Target—Identify textually explicit information within and across texts, such as sequence of events or actions in literary texts | These are similar "behaviors." Possible differences are that EXPLORE specifies "order" in contrast to NAEP's "identify", and NAEP allows that this behavior might occur across texts. |
| REL 402. Identify clear relationships between people, ideas, and so on in uncomplicated passages | Cog Target—Examine relations btw theme and setting or characters in literary texts PAch Def—"recognize character actions and infer and support character feelings" and "provide and support judgments about character motivation across texts" and "make and support a connection between characters from two parts of a (literary) text" in literary texts | These are similar "behaviors." One possible difference is that these behaviors are limited to literary text in NAEP, but no such restriction is present in EXPLORE |
| REL 403. Identify clear cause-effect relationships in uncomplicated passages | Cog Target—Describe problem and solution or cause and effect in literary and informational texts PAch Def—"interpret causal relations" in informational text | These are similar "behaviors." Possible differences are that NAEP specifies "interpret" in contrast to EXPLORE's "identify" and EXPLORE specifies uncomplicated passages, which NAEP does not. Additionally CRS supports "Identify clear cause-effect relationships in more challenging passages" (REL 505) |
| REL 501. Order sequences of events in uncomplicated passages | Cog Target—Identify textually explicit information within and across texts, such as sequence of events or actions in literary text | |
| REL 502. Understand relationships between people, ideas, and so on in uncomplicated passages | Cog Target—Make complex inferences within and across texts to examine relations between theme and setting or characters in literary text AAch Def—"able to make connections within and across texts" | |

| ACT College Readiness Standards EXPLORE (Benchmarks 13-25) | NAEP Grade 8 Achievement Definitions and Cognitive Targets | Similarities and Differences |
|---|---|---|
| REL 503. Identify clear relationships between characters, ideas, and so on in more challenging literary narratives | Cog Targets—Make complex inferences within and across texts to compare or connect ideas, problems, or situations in both literary and informational text AAch Def—"able to make connections within and across texts" | |
| REL 504. Understand implied or subtly stated cause- effect relationships in uncomplicated passages | Cog Target—Make complex inferences within and across texts to describe problem and solution or cause and effect in both literary and informational text PAch Def—"interpret causal relations" AAch Def—"able to explain causal relations" | |
| REL 505. Identify clear cause-effect relationships in more challenging passages | Cog Target—Identify textually explicit information within and across texts, such as causal relations" in informational text | |
| Meanings of Words (MOW) | | |
| MOW 201. Understand the implication of a familiar word or phrase and of simple descriptive language | BAch Def—"able to interpret the meaning of a word as it is used in the text" | |
| MOW 301. Use context to understand basic figurative language | Cog Target—Identify textually explicit information within and across texts, such as identify figurative language in literary texts BAch Def—"able to interpret the meaning of a word as it is used in the text" | |
| MOW 401. Use context to determine the appropriate meaning of some figurative and nonfigurative words, phrases, and statements in uncomplicated passages | Cog Target—Identify figurative language in literary texts PAch Def—"identify how figurative language is used" in literary texts and "recognize rhetorical devices" in informational texts | These are similar "behaviors", although EXPLORE specifies uncomplicated passages, but NAEP does not. The CRS expectation is much broader, but if more language from NAEP relative to its emphasis on vocabulary was included, then the two would be comparable. However, additionally, CRS supports "Use context to determine the appropriate meaning of some figurative and nonfigurative words, phrases, and statements in more challenging passages" (MOW 502) |
| MOW 501. Use context to determine the appropriate meaning of virtually any word, phrase, or statement in uncomplicated passages | BAch Def—"able to interpret the meaning of a word as it is used in the text" | |

| ACT College Readiness Standards EXPLORE (Benchmarks 13-25) | NAEP Grade 8 Achievement Definitions and Cognitive Targets | Similarities and Differences |
|--|---|--|
| MOW 502. Use context to determine the appropriate meaning of some figurative and nonfigurative words, phrases, and statements in more challenging passages | BAch Def—"able to interpret the meaning of a word as it is used in the text" | |
| Generalizations and Conclusions (GEN) | | |
| GEN 201. Draw simple generalizations and conclusions about the main characters in uncomplicated literary narratives | Cog Target—Consider text(s) critically to evaluate a character's motivations and decisions in literary text PAch Def—"able to provide and support judgments about character motivation across texts" | Behaviors for both assessments target attention to characters. It is not clear if the type of conclusions expressed by the CRS includes evaluating a character's motivations and decisions. |
| GEN 301. Draw simple generalizations and conclusions about people, ideas, and so on in uncomplicated passages | Cog Target—Make complex inferences within and across texts to examine relations between theme and setting or characters in literary text | |
| GEN 401. Draw generalizations and conclusions about people, ideas, and so on in uncomplicated passages | Cog Target—Draw conclusions and provide supporting information in informational text; Identify or interpret character's motivations & decisions in literary texts | These "behaviors" are closely related, however, NAEP adds the element of providing supporting information and does not limit the behavior to uncomplicated passages. However, additionally, CRS supports "Draw generalizations and conclusions about people, ideas, and so on in more challenging passages" (GEN 502). |
| GEN 402. Draw simple generalizations and conclusions using details that support the main points of more challenging passages | Cog Target——Draw conclusions and provide supporting information and find evidence in support of an argument in informational texts; compare or connect ideas, problems, or situations in literary and informational texts | These "behaviors" are not exactly the same, but do encompass similar abilities. |
| GEN 501. Draw subtle generalizations and conclusions about characters, ideas, and so on in uncomplicated literary narratives | Cog Target -Make complex inferences within and across texts to identify or interpret a character's motivations and decisions. | CRS is only within texts. |
| GEN 502. Draw generalizations and conclusions about people, ideas, and so on in more challenging passages | Cog Target -Make complex inferences within and across texts to identify or interpret a character's motivations and decisions. | CRS is only within texts and is more general to include people in general and ideas. |
| | PAch Def—"provide and support a judgment about the author's argument or stance" in informational text | This behavior reflects two dimensions of NAEP that are not explicitly specified in EXPLORE—the inclusion of argumentative text, and critique/evaluate questions |
| | Cog Target—Identify textually explicit information within and across texts, such as: character traits in literary text | CRS SUP 301 and 401 specify locating details without explicitly stating "character traits." |

| ACT College Readiness Standards EXPLORE (Benchmarks 13-25) | NAEP Grade 8 Achievement Definitions and Cognitive Targets | Similarities and Differences |
|--|--|--|
| | Cog Target—Identify textually explicit information within and across texts, such as: located specific information in text or graphics in informational text | |
| | Cog Target—Make complex inferences within and across texts to: determine unstated assumptions in an argument; describe how an author uses literary devices and text features in literary and informational text | |
| | Cog Target—Make complex inferences within and across texts to: infer mood or tone; explain how rhythm, rhyme, or form in poetry contribute to meaning in literary text | EXPLORE has corresponding items. CRS MOW 502 Use context to determine the appropriate meaning of some figurative and nonfigurative words, phrases, and statements in more challenging passages |
| | Cog Target—Make complex inferences within and across texts to: distinguish facts from opinion in informational text | EXPLORE has corresponding items. GEN 502. Draw generalizations and conclusions about people, ideas, and so on in more challenging passages |
| | Cog Target—Consider text(s) critically to: take different perspectives in relation to a text in literary and informational text | EXPLORE has corresponding items. REL 503. Identify clear relationships between characters, ideas, and so on in more challenging literary narratives |
| | Cog Target—Consider text(s) critically to: evaluate the role of literary devices in conveying meaning; determine the degree to which literary devices enhance a literary work; analyze the point of view used by the author in literary text | EXPLORE has corresponding items. MID 504. Understand the overall approach taken by an author or narrator (e.g., point of view, kinds of evidence used) in more challenging passages |
| | Cog Target—Consider text(s) critically to: evaluate the way the author selects language to influence readers; determine the quality of counterarguments within and across texts; judge the coherence, logic, or credibility of an argument in informational text | EXPLORE has corresponding items. SUP 503. Discern which details, though they may appear in different sections throughout a passage, support important points in more challenging passages. |

^{*} The primary sources of information used to complete the Side-by-Side Table are the EXPLORE College Readiness Standards for students scoring at Benchmarks 13-25, and the NAEP Achievement Level Descriptions for students scoring as Basic, Proficient, or Advanced at Grade 8. Additional information for the NAEP column comes from the Cognitive Targets Matrix.

Appendix C: Content Alignment Meeting Agenda

Content Alignment Studies of the 2013 National Assessment of Educational Progress (NAEP) for Grade 8 Reading and Mathematics and ACT EXPLORE Assessments of these Subjects

Content Alignment Institute: February 9 -- 13, 2015

Location: NORC at the University of Chicago Offices 4350 East-West Highway, 8th Floor Bethesda, MD 2081 (301) 634-9300

AGENDA

Day 1, Monday, February 9

| 8:00 am | Panelists check in at Suite 800, 8 th Floor | Room 832 |
|-----------|---|-----------------------------|
| 8:30 | Introductions – Rolf Blank, NORC Objectives of Content Alignment Studies project Overview of Content Alignment Institute | Room 834 |
| 9:00 | Overview of NAEP Grade 8 Mathematics and Reading assessments – Michelle Blair, National Assessment Governing Board | |
| 9:20 | Overview of ACT EXPLORE Mathematics and Reading assessments – Beth Sullivan, ACT | |
| 9:40 | Presentation on the Content Alignment Process – Norman Webb | |
| 10:30 | Break | |
| 10:45 | Panelists and Facilitators convene in Math and Reading subject groups Training on content area DOK definitions and how to log-on to WATv2 | Rooms 832, 834 |
| 12:30 pm | LUNCH (served at NORC) | Room 834 |
| 1:15 | Coding groups breakout sessions (4 groups) Assign DOK levels to NAEP Framework objectives | Rooms 718, 736, 832, 834 |
| 3:00 | Break | |
| 3:15-5:00 | Reading: Adjudicate NAEP DOK levels coding between groups | 1 |
| 4:00-5:00 | Math: Adjudicate NAEP DOK levels coding between groups | |
| 5:00 | Adjourn for day | |

Day 2, Tues., February 10

| 8:00 am | Panelists check in at Suite 800, 8 th Floor Room 832 | | |
|----------|---|---------------|--|
| 8:30 | Review Training – Norman Webb Room | | |
| 9:00 | Coding groups breakout sessions (4 groups) Code NAEP items to NAEP Frameworks Rooms 7 736, 832 | | |
| 10:15 | Break | | |
| 10:30 | Continue coding NAEP items to NAEP Frameworks | | |
| 12:00 pm | LUNCH (served at NORC) | Room 832 | |
| 1:00 | Continue coding NAEP items to NAEP Frameworks | Rooms 734, | |
| 3:00 | Break | 736, 832, 834 | |
| 3:15 | Reading and Math groups: Adjudicate NAEP item coding between groups | | |
| 4:45 | Individual feedback survey online | | |
| 5:00 | Adjourn for day | | |

Day 3, Wed., February 11

| 8:00 am | Panelists check in at Suite 800, 8 th Floor | Room 832 |
|-----------|--|---------------|
| 8:30 | Coding groups breakout sessions (4 groups) Code ACT items to NAEP Framework Rooms 7 736, 818 | |
| 10:15 | Break | |
| 10:30 | Continue coding ACT items to NAEP Framework | |
| 11:00 | Adjudicate ACT item coding to NAEP Framework | |
| 12:00 pm | LUNCH (served at NORC) Room 832 | |
| 1:00 | Assign DOK levels to ACT Standards Rooms 718 | |
| 3:15 | Break | 736, 818, 834 |
| 3:30-5:00 | Reading: Adjudicate ACT DOK levels coding between groups | |
| 4:00-5:00 | Math: Adjudicate ACT DOK levels coding between groups | |
| 5:00 | Adjourn for day | |

Day 4, Thurs., February 12

| 8:00 am | Panelists check in at Suite 800, 8 th Floor | Room 832 |
|----------|---|-----------------------------|
| 8:30 | Coding groups breakout sessions (4 groups) Code NAEP items to ACT standards | Rooms 718, 736, 832, 834 |
| 10:15 | Break | |
| 10:30 | Continue coding NAEP items to ACT standards | |
| 12:00 pm | LUNCH (served at NORC) | Room 834 |
| 1:00 | Continue coding NAEP items to ACT standards | Rooms 718, 736, 832, 834 |
| 3:00 | Break | |
| 3:15 | Reading and Math: Adjudicate coding of NAEP items to ACT Standards | |
| 4:45 | Individual feedback survey online | |
| 5:00 | Adjourn for day | |

Day 5, Fri., Feb. 13

| 8:00 am | Panelists check in at Suite 800, 8 th Floor | Room 832 |
|----------|---|-----------------------------|
| 8:30 | Coding groups breakout sessions (4 groups) Code ACT items to ACT Standards Rooms 7: 818, 832, | |
| 10:15 | Break | |
| 10:30 | Continue coding ACT items to ACT Standards | |
| 10:45 | Adjudicate ACT items to ACT Standards – in groups | |
| 12:00 pm | LUNCH (served at NORC) Room 834 | |
| 1:00 | Reading and Math: Adjudicate between groups coding ACT items to ACT standards | Rooms 736, 818, 832, 834 |
| 1:30 | Administration – Wrap-up | |
| 2:00 | Adjourn Institute | |

Appendix E.1: Recruitment Letter

November 3, 2014

Dear Educators and Leaders,

The National Assessment Governing Board (Governing Board) of the U.S. Department of Education, is funding an important study to expand what we know about the achievement of 8th graders across the country. The Governing Board oversees the National Assessment of Educational Progress (NAEP), regarded as the Nation's Report Card, and the Board is conducting research on the academic preparedness of students for college and job training.

In September 2014, the Governing Board contracted with NORC at the University of Chicago to conduct Content Alignment Studies of the Grade 8 Reading and Mathematics Assessments with the ACT Explore Assessments in these subjects.

We are seeking your help to identify and nominate mathematics and reading educators who can be an integral part of this important study, by serving as panelists in a 5-day Content Alignment Institute. Institute panelists will review and analyze the subject content included in two national assessments: NAEP and ACT Explore. Both assessments provide key information on student achievement and may indicate the extent to which students are on track toward being prepared for college and careers by the end of grade 12. We need educators who have significant experience with mathematics or reading instruction or assessment at the 8th grade level, and are interested in working with a team of educator colleagues. Institute panelists will work in 8-person teams, and can include classroom teachers, curriculum coordinators, instructional coaches, content area assessment specialists, or district- or state-level specialists.

The Institute will be held **February 9 (8:30 am start) through February 13, 2015 (3:00 pm end),** at the NORC offices just outside Washington, DC in Bethesda, Maryland. Our experience in conducting many prior assessment studies shows that educators find their participation in these studies to be a first-class hands-on professional learning experience. All travel, hotel, meal, and ground transportation expenses will be paid by the project. Each participant will receive a \$300 Institute honorarium, and, as needed, the cost of substitute staff will be paid to the sending school or district of participating panelists. Please see the attached document for more information on the project and how to submit your Institute panelist nominations to project director Rolf Blank **by November 21, 2014**.

Thank you for your support and consideration. We look forward to hearing from you. Sincerely,

/Cornelia S. Orr/

/Rolf K. Blank/

Cornelia S. Orr, Ph.D. Executive Director, National Assessment Governing Board Rolf K. Blank, Ph.D. NORC Project Director **Appendix E.2: Panelist Letter for CAI**

January 28, 2015

Dear NAEP/ACT EXPLORE Alignment Study Participant:

Thank you for agreeing to take part in this very important project. We are looking forward to working with you **February 9-13** (**Monday through Friday**) **2015** for the Content Alignment Institute to be convened at the NORC facilities located at:

4350 East-West Highway, Suite 800 Bethesda, Maryland 20814

You have already received communication from NORC regarding travel and hotel arrangements for the Institute in February. This email has additional information and materials in preparation for the Content Alignment Institute (CAI).

We very much appreciate your willingness to devote the week to this important study for the National Assessment Governing Board (Governing Board). During the week, you will be trained on a process that has been used to study the alignment between content standards and assessments for a number of states over the past 15 years. For this project, the process has been adapted slightly for analyzing the alignment between the 2013 NAEP grade 8 assessments and the ACT EXPLORE. The training will include instruction on the Depth-of-Knowledge (DOK) levels definitions that will be used in the study for analyzing content complexity. After you have been trained on the process and the DOK definitions, you will be asked to:

- 1. Assign a DOK level to each of the expectations in the NAEP grade 8 framework
- 2. Code the NAEP grade 8 assessment to the NAEP standards and objectives
- 3. Code two forms of the ACT EXPLORE to the NAEP standards and objectives
- 4. Assign a DOK level to each of the standards in the ACT College and Career Readiness Standards
- 5. Code the NAEP grade 8 assessment to the ACT College and Career Readiness Standards
- 6. Code two forms of the ACT EXPLORE to the ACT College and Career Readiness Standards

NORC at the University of Chicago | 4350 East-West Highway, 8th Floor, Bethesda, MD 20814 (301) 634-9300 | www.norc.org

The design of the study includes mapping the assessment from each group to the set of standards representing each assessment. This information will then be used to draw inferences on how the two assessments are aligned.

On Monday, February 9, we will begin the Content Alignment Institute at 8:00 AM with registration (Please report promptly at 8:00 to Room 800 at 4350 East-West Highway, Bethesda, MD—note that the meeting will NOT include breakfast).

At 8:30 AM we start with introductions and information you will need to do the analysis. There will be two groups of eight panelists for each of the content areas: reading and mathematics. The two panels will code data independently as a replication of each other. Each group will be led by a facilitator*:

| Reading Group 1 | |
|---------------------|--|
| Reading Group 2 | |
| Mathematics Group 1 | |
| Mathematics Group 2 | |

Norman Webb, the CAI Technical Coordinator leading the content analysis, has worked with all four facilitators for a number of years and we are pleased that they will be providing leadership during the Institute. You will learn your group assignment at the beginning of the Institute on February 9.

The amount of work we have to complete during the five days is such that you will be busy nearly all of the time. We will begin each day at 8:30 AM. Please arrive at NORC offices by 8:00am each day to ensure timely check in each day. We will end each day at 5:30 PM. On Friday, February 13, we will conclude the Institute by 2:00 PM.

All of the coding will be done using the WATv2, an on-line software designed by the Wisconsin Center for Education Research (WCER) for conducting alignment studies. Laptop computers will be provided so you do not need to bring your own. There is nothing you are required to do prior to arriving at the Institute. For those who want some background information, we are sending a list of resources about the assessments and content alignment studies.

You should already be in contact with NORC staff to make your travel arrangements. Reservations have been made for all panelists at the Hilton Garden Inn, 7301 Waverly Street, Bethesda, Maryland, 20814, 301-654-8111. The hotel room will be direct billed, and you will just need to supply a credit card for incidentals upon your arrival at check-in. You will be reimbursed for transportation (airport to hotel) and meals according to the daily per diem. Please see additional materials provided regarding transportation to and from the airport to the hotel, as well as instructions for reimbursement.

We are very pleased with the quality of panelists who have agreed to participate in the Content Alignment Institute. The group will represent a large proportion of the states and include a range ¹of backgrounds and experiences. The data you will provide will be used by the Governing Board to determine to what the degree the grade 8 NAEP assessments correspond to the ACT EXPLORE as one measure of how well grade 8 students are making progress towards being prepared for college or careers after high school.

If you have any questions about the Institute, please contact NORC staff at ContentAlignmentInstitute@norc.org or 1-866-315-7124.

Safe travels and see you on Monday, February 9.

Norman Webb CAI Technical Coordinator Wisconsin Center for Education Products and Services nlwebb@wisc.edu

Appendix F: Alignment Institute Security Protocol and Procedures

Alignment Institute Security Protocol and Procedures

The following security protocol was used to conduct the Content Alignment Institute (CAI) from February 9 to 13, 2015. No security breaches were experienced.

The CAI was conducted at the NORC facility at 4350 East West Highway in Bethesda, Maryland. The reserved conference rooms include one large room for the plenary training session on day one (32 panelists plus facilitators), two rooms for subject area training on day one (16 panelists plus facilitators, and four breakout rooms for the following four days (8 panelists per room plus facilitator). The conference rooms are located on two floors of the building. The building internet hard-wire connections will be used for linking all of the panelists PCs to the internet which will provide them access to the WATv2 online data input and analysis system at WCEPS

The WATv2, a web-based tool, was used at the CAI for all data collection. All data entered in the WATv2 was stored on a server maintained at WCEPS. Access to the administrative functions is restricted and is password protected. The panel facilitators had access to data entered by members of his or her group. The technical coordinator, who will have administrative access, had access to data entered by all panelists. This allowed the technical coordinator to monitor the data entry process in real time and to intervene if some problem or issue arose.

The assessment items reviewed during the CAI were kept secure at all times. Individuals reviewing items all signed non-disclosure agreements for both NAEP and ACT EXPLORE items. Hard copies of the items were maintained by the NORC Project Director and when not in use, were stored in a locked room at the NORC facilities. A record of each set of assessment items assigned for review by a panelist were maintained by the Project Director, and when completed, each set of items was returned and stored in a locked room at the NORC facility.

NORC arranged for each facilitator and panelist to have access to a personal computer that will be wiped clean of all other data. The computers met the federal regulations for Section 508 compliance. All of the data were entered through the PCs into the WATv2 online system, and data were *not* stored or saved on the laptops, thus providing a secure data environment.

Appendix G.1: Introduction Slides

Content Alignment Studies of the 2013 National Assessment of Educational Progress (NAEP) for Grade 8 Reading and Mathematics and ACT Explore Assessments of these Subjects Content Alignment Institute: February 9 - 13, 2015

WELCOME EDUCATORS!

PROJECT OVERVIEW

OBJECTIVES:

- Content Alignment Studies: What is the degree of alignment between Grade 8 NAEP Mathematics, Reading and ACT EXPLORE assessments in Math, Reading?
- 2. We analyze subject content of Assessments to Expectations /Standards for NAEP and ACT EXPLORE.
- 3. Larger Goal: How well assessments measure preparedness for HS courses and college.
- 4. Content Alignment Institute Educators provide the data for Content Analysis using a well-tested method used in state and national studies.
- 5. NORC and WCEPS organize and lead the content analysis, and report findings to the National Assessment Governing Board.

Who We Are

Panelists – Reading (16) and Mathematics (16)

Facilitators: John Fortier, Cynthia Jacobson, Linda McQuillen, Mary L. Raith

Technical Coordinator: Norman Webb (WCEPS), Project Director: Rolf Blank (NORC)

Associate Director: Cindy Simko, Logistics: Rebecca Oran, Tina Weimer

National Assessment Governing Board: Michelle Blair, Sharyn Rosenberg

National Center for Education Statistics/NAEP: Elvie Hausken, Gabrielle Merken; Kim Gattis (AIR)

ACT Project Director: Beth Sullivan

- Mathematics: Scott Johanningmeier and Darla Simpson
- Reading: Rachel Cieslak and Nathan Eilers

Important items

- Check-in and check-out each day your signature
- Laptop sign-out, sign-in each day
- NAEP, EXPLORE copies secure day 2, 3, 4, 5 -- sign-out, sign-in
- Name tags and office entry
- Expenses per diem food (receipts not required)
- Ground transportation keep your receipts
- Feedback using surveys day 2 and day 4

Appendix G.2: CAI Presentation for NAEP

The National Assessment Governing Board and NAEP: An Overview

February 9, 2015

Michelle Blair
Senior Research Associate
National Assessment Governing Board

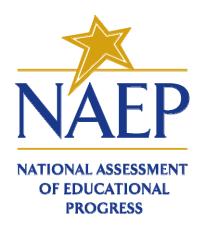

National Assessment Governing Board

An independent bipartisan board established by Congress in 1988 to set policy for and oversee NAEP:

- Determine the assessment schedule
- Develop frameworks
- Review and approve assessment and survey items
- Design methodology for validity and reliability
- Set achievement levels
- Release assessment results

Membership (26) includes governors, legislators, teachers, principals, state superintendents, state board members, testing and measurement experts, and general public

National Assessment of Educational Progress (NAEP)

- Nationally representative ongoing measure of student achievement
- Reports group-level performance (no results for individual students)
- Provides state-comparable results in several subject areas
- Administered by the National Center for Education Statistics (NCES), which is responsible for NAEP operations

Conducting NAEP requires services from an array of contractors for:

- Test Development
- Sampling and Test Administration
- Scoring, Analysis, and Reporting

NAEP: The Nation's Report Card

| Assesses what students know and can do: | | | | |
|---|--------|--|--|--|
| SUBJECTS | GRADES | | | |
| Reading, Mathematics, Writing, Science, U.S. History, Civics, Geography, Economics, the Arts, Technology and Engineering Literacy 4, 8, and 12 | | | | |
| RESULTS | | | | |
| Student Achievement Data for the - Nation - States - 21 Urban Districts | | | | |
| | | | | |

NAEP Assessment Frameworks

- Describe the content and format of a NAEP assessment
 - What to measure at each grade (content objectives)
 - How to measure it (item types)
 - How achievement levels are to be represented (for Basic, Proficient, and Advanced performance in a subject)
- Written for educators, policymakers, and citizens
- Address considerations from:
 - Current instructional and measurement issues
 - Technology needs and availability
 - Research on cognitive development and learning
 - State standards and assessments
 - International standards and assessments
 - Key reports of national or international significance

How are NAEP Assessment Frameworks Developed?

- Educational leaders across the country are assembled for a comprehensive, inclusive, and deliberative process
 The group:
 - Drafts a recommended assessment framework
 - Engages in several levels of outreach to collect and incorporate feedback from the public
 - Presents drafts for Governing Board review
 - Presents final draft for Board approval

After NAEP frameworks are developed:

- NCES works to develop test items aligned to framework
- Governing Board reviews each item for approval

Who takes NAEP?

- National samples
- State samples
- Urban district samples

In a NAEP administration:

- Each student takes only a small portion of the items in a subject area
- NAEP field staff visit schools to test students

How is NAEP Reported?

- Scale scores
- Achievement levels
 - Aligned to generic policy definitions of Basic, Proficient, and Advanced, and the content of each NAEP framework
 - Reported via cut scores set by a national panel of educators and members of the general public
- Exemplar items
- Interactive formats
- Other online tools
 - NAEP Data Explorer
 - NAEP Sample Questions Tool

NAEP 8th Grade Mathematics

- Content areas include:
 - Number Properties and Operations including computation and understanding of number concepts
 - Measurement including use of instruments, application of processes, and concepts of area and volume
 - Geometry including spatial reasoning and applying geometric properties
 - Data Analysis, Statistics, and Probability including graphical displays and statistics
 - Algebra including representations and relationships
- *Items:* 153 items total (50% multiple choice; 50% constructed-response)
- Testing time: 50 minutes total, consisting of two 25-minute blocks
- Calculator-active (allowed): one-third of the blocks
- Score scale: 0 to 500
- 2013 Sample: 6,520 schools; 170,100 students

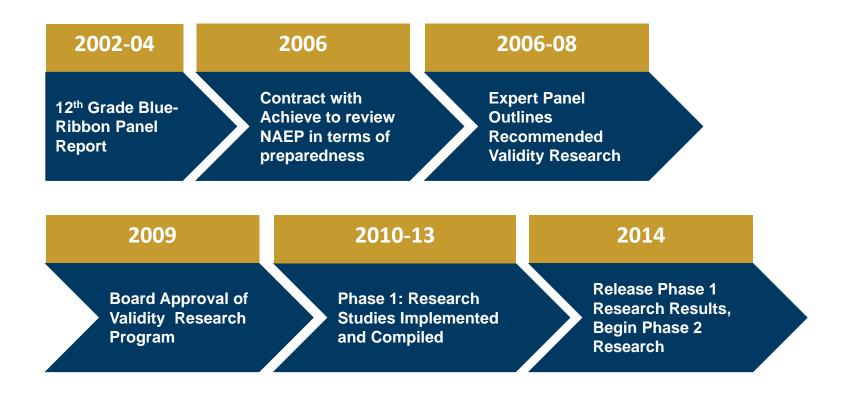

NAEP 8th Grade Reading

- Focused on reading comprehension relative to:
 - **Literary texts** include fiction, literary nonfiction, and poetry
 - **Informational texts** include expository, argumentative and persuasive, procedural, and document texts
- *Items:* 163 items total (40% multiple choice; 60% constructed-response)
- Testing time: 50 minutes total, consisting of two 25-minute blocks
- Score scale: 0 to 500
- 2013 Sample: 6,510 schools; 171,800 students

Overview: NAEP Preparedness Research Program

NAEP Preparedness Research Approach: Multimethod

Over 30 studies across several research areas:

- **★** Content Comparison
- Statistical Linking
- ★ Standard Setting
- ★ Benchmarking
- Higher Education Survey
- **★ Course Content Analyses (College and Job Training)**

Benefits of Understanding How NAEP relates to EXPLORE

• EXPLORE:

- Established measure of being on track for academic preparedness outcomes
- Backed by several years of ACT research

Data:

- Same samples of 8th graders took NAEP and EXPLORE during the 2012-2013 school year
- Statistical linking of results for NAEP and EXPLORE
- Content comparisons enable understanding:
 - 8th grade student achievement
 - Progress toward academic preparedness for college

Appendix G.3: ACT EXPLORE Presentation

Content Alignment Institute: February 9 -- 13, 2015

ACT Explore Overview

ACT Introductions

Content Alignment Institute: February 9 -- 13, 2015

- Project Director: Beth Sullivan
- Mathematics Content Leads: Scott Johanningmeier and Darla Simpson
- Reading Content Leads: Rachel Cieslak and Nathan Eilers

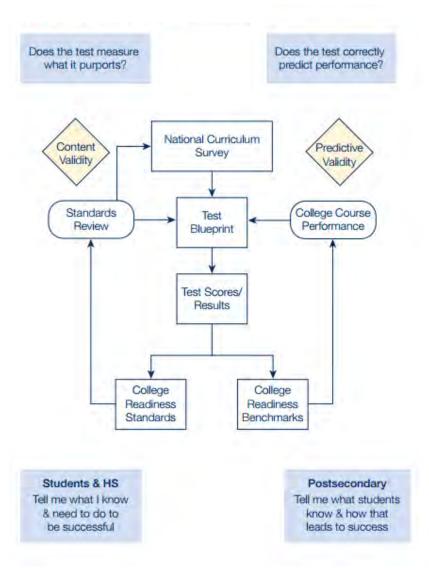

ACT Explore Overview and Purpose

- Four curriculum-based assessments: English, Mathematics, Reading, and Science.
- Assesses academic progress at the eighth- and ninth-grade levels
- Helps students understand and begin to explore the wide range of career options
- Assists students and educators in developing a high school coursework plan
- Output
 - Your Scores
 - Your Plans
 - Your Career Possibilities
 - Your Skills
- Part of an integrated series of assessments which include Explore, Plan®, and The ACT®
- Scored on a common scale, maximum Explore score is 25

The Science of ACT Assessments

The ACT National Curriculum Survey®

- Conducted every three to four years
- What are educators teaching?
- What do students need to know and be able to do?
- Guides test blueprints (content specifications)

Test Blueprint - Mathematics

Content Specifications for the ACT Explore Mathematics Test

The items in the Mathematics Test are classified according to four content categories. These categories and the approximate proportion of the test devoted to each are given below.

| Mathematics content area | Proportion of test | Number of items |
|--------------------------|--------------------|-----------------|
| Pre-Algebra | .33 | 10 |
| Elementary Algebra | .30 | 9 |
| Geometry | .23 | 7 |
| Statistics/Probability | .14 | 4 |
| Total | 1.00 | 30 |

- a. Pre-Algebra. Items in this category are based on operations with whole numbers, integers, decimals, and fractions. The topics covered include place value, square roots, scientific notation, factors, ratio, and proportion and percent. Formal variables are not used.
- b. Elementary Algebra. The items in this category are based on operations with algebraic expressions. The operations include evaluation of algebraic expressions by substitution; use of variables to express functional relationships, solution of linear equations in one variable, use of real number lines to represent numbers, and graphing of points in the standard coordinate plane.
- c. Geometry. Items in this category cover such topics as the use of scales and measurement systems, plane and solid geometric figures and associated relationships and concepts, the concept of angles and their measures, parallelism, relationships of triangles, properties of a circle, and the Pythagorean theorem. All of these topics are addressed at a level preceding formal geometry.
- d. Statistics/Probability. Items in this category cover such topics as elementary counting and rudimentary probability; data collection, representation, and interpretation; and reading and relating graphs, charts, and other representations of data. These topics are addressed at a level preceding formal statistics.

Test Blueprint - Reading

Content Specifications for the ACT Explore Reading Test

The items in the Reading Test are based on the prose passages that are representative of the kinds of writing commonly encountered in middle-school and junior-high school curricula, including the social sciences, prose fiction, and the humanities. The three content areas and the approximate proportion of the test devoted to each are given below.

| Reading passage content | Proportion of test | Number of items |
|-------------------------|--------------------|-----------------|
| Prose Fiction | .33 | 10 |
| Social Sciences | .33 | 10 |
| Humanities | .33 | 10 |
| Total | 1.00 | 30 |

- a. Prose Fiction. The items in this category are based on short stories or excerpts from short stories or novels.
- Humanities. The items in this category are based on passages from memoirs and personal essays, and in the content areas of architecture, art, dance, ethics, film, language, literary criticism, music, philosophy, radio, television, or theater.
- Social Sciences. The items in this category are based on passages in anthropology, archaeology, biography, business, economics, education, geography, history, political science, psychology, or sociology.

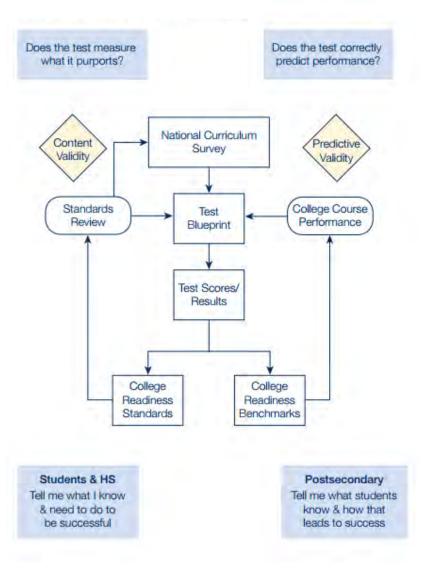

ACT College Readiness Standards

- Outcome of analysis of nationwide sample of student scores and responses
- Defines a progression of skills
- Cumulative
- Organized by strands and score ranges
- Common score scale

The Science of ACT Assessments

Overview

- 30 multiple-choice items
- 30 minutes
- Attempts to measure mathematical reasoning
- Does not focus on memorization or computational skills

Calculator usage

- What is expected?
- What is allowed?
- Calculator taxonomy

ACT Explore Reading Assessments

Overview

 3 passages (prose fiction, social science, humanities)

- 30 multiple-choice items
- 30 minutes
- Questions provide good coverage of College Readiness Standards and various levels of cognitive complexity

ACT Explore Reading Assessments

- Prose Fiction: Excerpts from short stories and novels
 - Uncomplicated
 - More Challenging
- Informational texts: Excerpts from social science and humanities articles and essays
 - Uncomplicated
 - More Challenging

ACT Explore Reading Assessments

College Readiness Standards for Reading

- Main Ideas and Author's Approach (MID)
- Supporting Details (SUP)
- Sequential, Comparative, and Cause-Effect Relationships (REL)
- Meaning of Words (MOW)
- Generalizations and Conclusions (GEN)

ACT Explore reading

- Test items require the student to derive meaning from the texts by:
 - Referring to what is explicitly stated
 - Reasoning to determine implicit meanings and to draw conclusions, comparisons, and generalizations

ACT Explore

Questions?

Appendix G.4: Norman Webb Presentation

Content Alignment Study 2013 NAEP and ACT EXPLORE Reading and Mathematics

NORC 4350 West-West Highway, 8th Floor Bethesda, Maryland February 9-13, 2015

Alignment

The degree to which expectations and assessments are in agreement and serve in conjunction with one another to guide the system toward students learning what is expected.

Alignment Process

- Identify Standards and Assessments
- Select Panelists (Content Experts)
- Train Panelists on DOK Levels
- Part I: Assign DOK Levels to Standards/Benchmarks
- Part II: Code DOK Levels and Standards of Assessment Items

Study Design

Mathematics

Group 1

Group 2

Reading
Group 1
Group 2

Steps for Study

- Receive training on process and DOK levels
- Assign DOK to NAEP expectations
- Code NAEP assessment items to NAEP expectations
- Code ACT EXPLORE items to NAEP expectations
- Assign DOK to ACT College Readiness Standards
- Code NAEP assessment items to ACT College Readiness Standards
- Code ACT EXPLORE items to ACT CRS

Specific Criteria

Content Focus

- A. Categorical Concurrence
- B. Depth-of-Knowledge Consistency
- C. Range-of-Knowledge Correspondence
- D. Balance of Representation

Depth of Knowledge

Level 1 Recall

Recall of a fact, information, or procedure.

Level 2 Skill/Concept

Use information or conceptual knowledge, two or more steps, etc.

Level 3 Strategic Thinking

Requires reasoning, developing plan or a sequence of steps, some complexity, more than one possible answer.

Level 4 Extended Thinking

Requires an investigation, time to think and process multiple conditions of the problem.

EXAMPLE OF STANDARDS AND DEPTH-OF-KNOWLEDGE LEVELS CONTENT AREA: GEOMETRY

| | Mathemati | cs Standard | Depth-of- |
|--------------------|---|----------------------------------|-----------|
| | | | Knowledge |
| | | | Level |
| State D Grade 8 | VI. Geometric and Spatia | l Sense | |
| VI.2 | Explore transformations of ge | ometric figures. | 3 |
| State B Grade 8 | II. Geometry | | |
| II.4 | Graph on a coordinate plane s translations. | imilar figures, reflections, and | 2 |
| State A Grade 6 | IV. Geometry and Spatial | Sense | |
| IV.D. | Investigate and predict the res shapes, figures, and models in turns. | | |
| IV.D.1 | Identify and describe the result reflections (flips), rotations (to | | 2 |

EXAMPLE OF STANDARDS AND DEPTH-OF-KNOWLEDGE LEVELS CONTENT AREA: PROBABILITY AND STATISTICS

| | Mathematics Standard | Depth-of- |
|--------------------|--|-----------|
| | | Knowledge |
| | | Level |
| State D Grade 8 | VII. Data Analysis, Probability & Statistics | |
| VII.3 | Formulate, predict, and defend positions taken that are based on data collected. | 3 |
| State B Grade 8 | VI. Probability and Statistics | |
| VI.1 | Collect data involving 2 variables and display on a scatter plot; interpret results. | 3 |

Which of these means about the same as the word gauge?

a. balance

b. measure

c. select

d. warn

A car odometer registered 41,256.9 miles when a highway sign warned of a detour 1,200 feet ahead. What will the odometer read when the car reaches the detour? (5,280 feet = 1 mile)

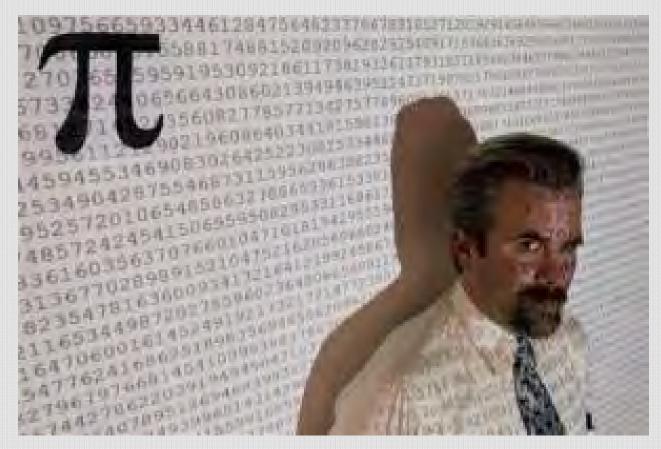

- (a) 42,456.9
- (b) 41,279.9
- (c) 41,261.3
- (d) 41,259.2
- (e) 41,257.1

Did you use the calculator on this question?

Which of these conclusions is best supported by information from the passage?

- a. If a candidate meets the personal and educational qualifications and is in fair physical shape, his or her chances of becoming an agent are very good.
- b. Compared with other law enforcement agencies in the country, the F.B.I. has a low success rate for tracking down and apprehending suspected offenders.
- c. The job of an agent is not for everyone; it takes someone with special training who is not afraid of danger and doesn't mind being socially isolated at times.
- d. The life of a federal investigator is not as interesting as most people think; agents spend most of their time working at desks.

It Is Still A Level 1

Marc Umile poses for a picture in front of a projection of the string of numbers knows as pi in Philadelphia, Friday, March, 2, 2006. Umile is among a group of people fascinated with pi, a number that has been computed to more than a trillion decimal places. He has recited pi to 12,887 digits, perhaps the U.S. record. (AP Photo/Matt Rourke)

Coding Process Tips

- One primary standard/objective/target and up to two secondary standards (if necessary)
- Source of Challenge (a correct/incorrect response for the wrong reason)
- Think of the typical grade 8 student
- Notes (any insights to share)
- Consider full range of standards
- Use generic standard sparingly

Notes

A good note provides sufficient information to decipher the activity:

- The item only targets a small part of the objective—make an ordinary inference using text features.
- Generic standard used because no computation of square root only estimation.

Notes

A poor note states the obvious or repeats what is recorded elsewhere:

- The activity does not have a standard. It matches 4.7.8 student expectation A.
- This activity connects to the standard, loosely.

Notes

- Brief and to the point
- What essential part of the standard does the activity match?
- How does activity relate to typical grade level student?
- Does the activity fit?

Debriefing Questions

- A. What major topics or subtopics were only partially covered by assessment items or did not have any corresponding items?
- B. In what ways did the performance (DOK levels) required by the assessment items meet or did not meet the full performance as expected by the standards?
- C. Compared to other assessments being analyzed, how does this assessment align to the set of standards or expectations?

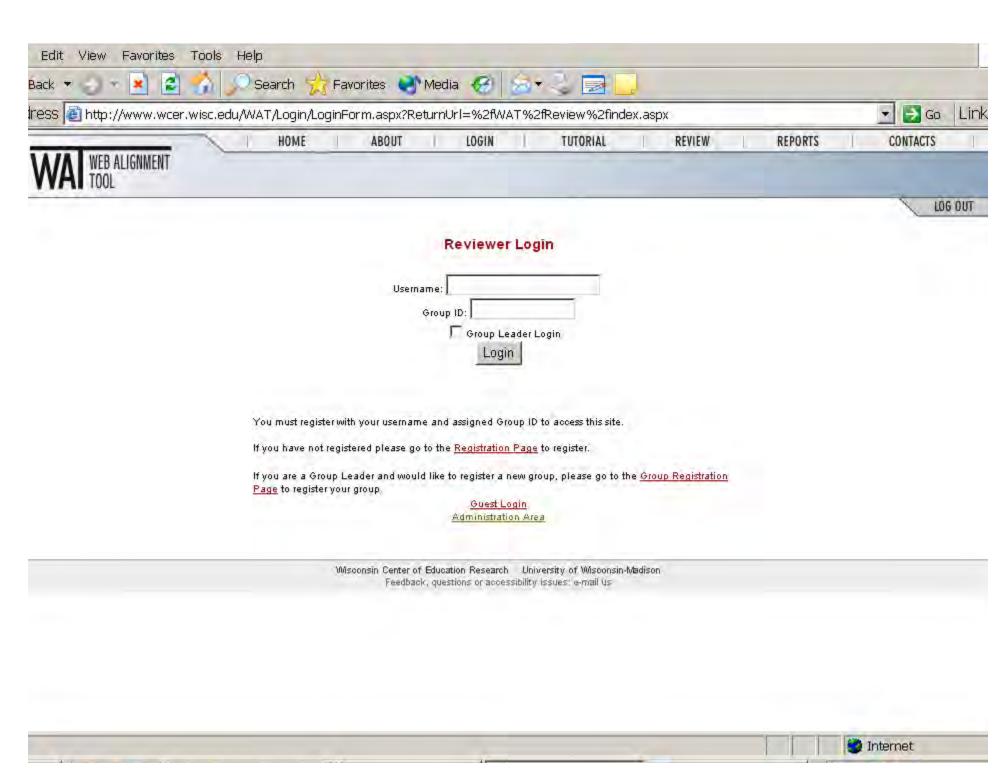

Welcome to Web Alignment Tool

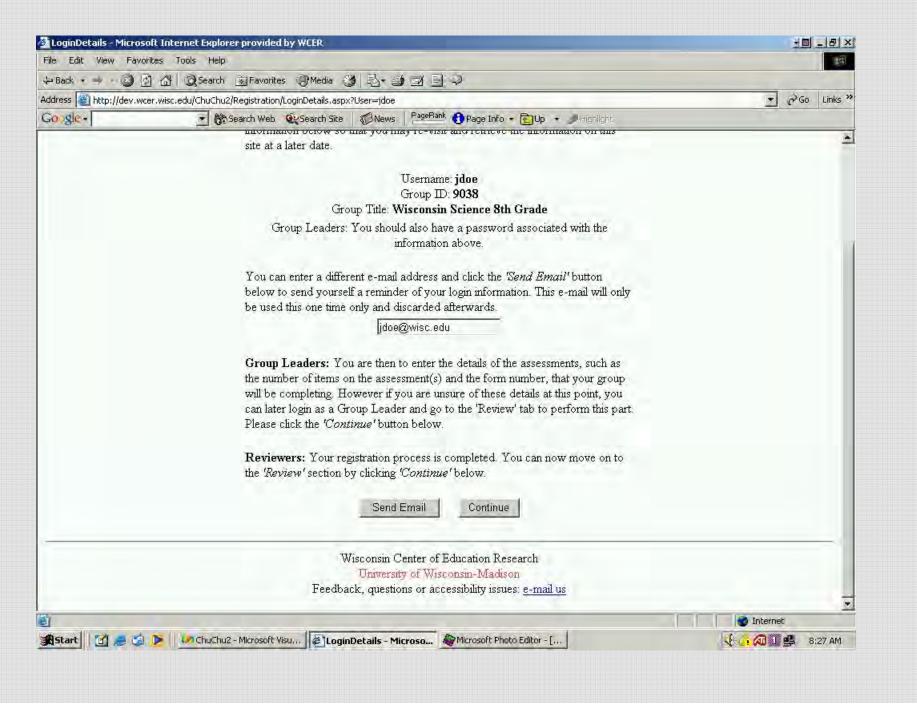

This tool is designed to produce reports on the alignment of curriculum standards and student assessments.

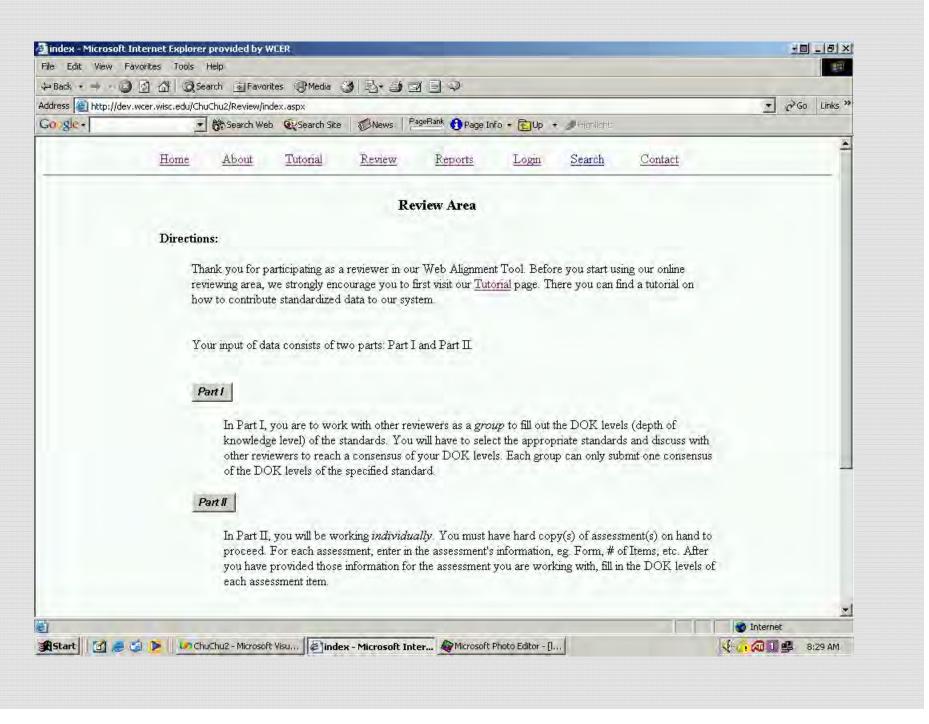

The process requires a group of reviewers first to assign depth-of-knowledge (DOK) levels to standards/objectives (Part I). Then reviewers are to code assessment items by identifying the depth-of-knowledge for each item and the corresponding standard/objective (Part II).

- 1. The steps in using this tool and the process include
- 2. Training on DOK levels for content area
- 3. Logging on
- 4. Selecting a state, content area, and grade
- 5. Individually coding DOK for each objective
- 6. Group reaching consensus on the DOK for each objective
- 7. Coding independently the DOK for each assessment item and corresponding objective(s)
- 8. Recording Source of Challenge and Notes

Appendix H: Training Materials and Participant Information Packet

Appendix H.1: NAEP CAI Participant Information Packet

Dear Content Alignment Institute (CAI) Participants and Guests,

Welcome!

In order to ensure that the Content Alignment Institute runs smooth and orderly, we have included some information, directions, and maps, along with a few simple instructions that all guests of NORC offices will need to follow. Please review this material prior to your arrival in Bethesda, MD. If you have any questions, don't hesitate to contact us directly at:

ContentAlignmentInstitute@norc.org or by phone at 1-866-315-7124

Hotel and NORC Offices

Panelists and Facilitators will have accommodations for FIVE NIGHTS at:

Hilton Garden Inn

7301 Waverly Street Bethesda, Maryland, 20814 301-654-8111

You are free to use your HHonors rewards number. If you provided this to NORC prior to your travels, we were able to give the number to the Hilton Garden Inn, however we recommend that you confirm upon check-in.

Your hotel room has been pre-paid, however you will be required to provide a credit card for incidentals. Please refer to the reimbursement section of this document for information on what is an allowable expense.

Walking from the Hilton Garden Inn to Bethesda Towers (NORC Office) (10–15 minute walk):

 Coming out of the hotel, take a right heading north on Waverly St. You will cross Montgomery Ave.

- At the intersection of Waverly and East-West Highway, take a right onto East-West Highway and continue walking for a few blocks (you will pass a Starbucks and a construction site).
- 4350 East-West Highway will be on your right, directly across from the Chevy Chase High School.
- Please note that Facilitators and Panelists can take a reimbursable taxi from the Hilton Garden Inn to the NORC office. If you choose to take a taxi, please keep your receipt for reimbursement.

Parking at Bethesda Towers (NORC Office) or at the Hilton Garden Inn:

Hotel guests are encouraged to park at the Hilton Garden Inn and walk or take a taxi to the Bethesda Towers (location of the NORC offices). If you are not staying at the hotel and choose to drive to NORC's office, you can park at the Bethesda Towers building.

Driving Directions to 4350 East-West Highway, Bethesda Towers building:

From Northern VA:

- Take I-495 N/ CAPITAL BELTWAY toward ROCKVILLE/ BALTIMORE (Crossing into MARYLAND).
- Take EXIT 33, MD-185 S/CONNECTICUT AVE toward CHEVY CHASE & bear right on ramp.
- At approx. the 4th Traffic Light, Turn RIGHT onto MD-410 W/ EAST-WEST HWY

(The 3 bulleted instructions below are consistent from all routes listed here.)

- Stay in the LEFT lane. East-West Highway (MD-410) becomes One-Way just before the Traffic Light at Chelton Road.
- Go through the Chelton Road intersection and immediately look to the left for the access road.
 Merge LEFT onto access road.
- The entrance to Bethesda Towers and the Parking Garage will be on your left. (See detailed instructions on next page for Parking at Bethesda Towers and Accessing NORC Offices.")

From Maryland:

- Take I-95 S via the exit on the LEFT toward WASHINGTON,
- Merge onto I-495 W/ CAPITAL BELTWAY via EXIT 27 toward SILVER SPRING
- Merge onto MD-185 S/ CONNECTICUT AVE via EXIT 33,
- Turn RIGHT onto MD-410 W/ EAST-WEST HWY,
- Follow last 3 bulleted instructions above.

From Washington DC:

- Start out going west on Constitution Ave. NW/ US-50 toward 16th St. NW
- Turn RIGHT onto 17th St. NW
- 17th St. NW becomes Connecticut Ave NW, Turn slight left to stay on Connecticut Ave.
- Enter next roundabout and take 3rd exit to continue on Connecticut Ave. (Crossing into Maryland)
- Turn LEFT onto MD-410 W/ EAST-WEST HWY.
- Follow last 3 bulleted instructions above.

The parking rate at Bethesda Towers (4350 East-West Highway) is approximately \$15/day and is payable only by credit card. If you are a CAI participant (Panelists and Facilitators) and you choose to park at Bethesda Towers, please bring your parking ticket to the meeting for validation: your parking is of no charge to you.

To access the parking garage (map below):

- Coming from Connecticut Avenue, turn onto East-West Hwy (MD410-West). Stay in the left lane.
- As you approach the one-way section of East-West Hwy you should be able to view the white Bethesda Towers buildings ahead on the left. (We are across the street from Bethesda Chevy-Chase High School).
- As you approach the traffic light at Chelton Rd, drive slowly beyond the light and take the first small access road on the left. You must left-merge onto this road in order access the parking garage for Bethesda Towers. This is easy to miss so stay alert!
 - o <u>If you miss the access road</u>, go around the block and try again. Make the next left on Pearl St, then the next left on Montgomery Ave, then the next left back onto East-West Hwy and finally the first left onto the access road.
- Once on the access road, pass the grassy island, turn left and you will see the
 entrance into the parking garage on the right. Once inside the garage, park
 your car near the 4350 building entrance.

Additionally, please be aware that there are municipal garages with coin operated meters about 2 blocks away that offer hourly/daily parking. The closest garage is Waverly Garage.

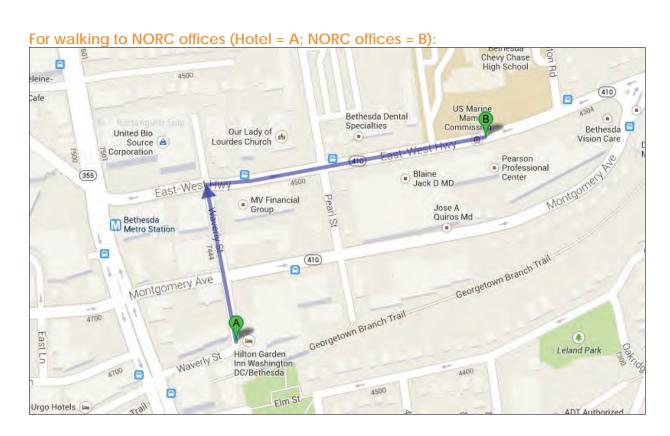

Please see the following link for a map of nearby municipal garages and their location:

http://www.downtownbethesda.com/guide/community.php?md=98

Maps:

For Bethesda Tower parking:

Arrival at NORC Offices

On Monday, February 9, we will begin at 8:00 AM with registration. At 8:30 AM we will start the Institute, so please arrive by 8:00am to ensure timely checking with security.

NORC takes security very seriously. Upon arrival at NORC's office, you will take the elevator to the 8th floor.

You will be greeted by an NORC staff person, and required to sign in at the reception area. You will then be escorted to **NORC's CAI Check-in room**. This room will serve as your **FIRST** and **LAST** stop during each day of the Institute.

You will be required to show a photo ID each day, and you will sign in and out. You will be provided with a VISITOR'S badge that you MUST wear throughout the entire time you are at NORC's offices.

For security purposes, all guests of NORC must be escorted when not in their respective meeting and break-out rooms. We will have staff available to assist in keying you in and out of areas so that you may visit the rest room, etc.

NORC will be providing an area for you in the event that you need to make or receive personal cell phone calls. Alert a member of the project staff and s/he will escort you to that area.

Securing Your Work Materials and Personal Items

All guests that will be either participating or observing the Institute will be required to sign two Confidentiality Forms upon arrival: One for ACT and one for NAEP. These signed forms will be collected and archived by the project.

At the point of check-in/check-out, NORC will also require that Panelists and Facilitators sign in/out the NORC-provided laptop and other confidential materials that will be used during the Institute. Panelists and Facilitators will be responsible for these items each day. These items will then be locked in a secure location overnight. NORC will also have space for all those attending the CAI to securely store your personal effects (coats, bags, etc.).

Meals

BREAKFAST AND DINNER <u>WILL NOT</u> BE PROVIDED AT THE CAI. Please ensure that you have eaten prior to arriving at NORC facilities.

Coffee:

Coffee will be served at 8:30 am upon check-in at the NORC's office.

Lunch:

Lunch and a light afternoon snack will be provided.

Instructions for Participants to Submit Request for Honorarium and Reimbursement of Travel Expenses

Honorarium:

NORC will reimburse all expenses related to travel for the *NAEP Content Alignment Institute* in accordance with Federal guidelines. In order to submit for reimbursement you must complete the honorarium payment form requesting your honorarium and for reimbursement of travel-related expenses not already covered by NORC. Please fill out the personal information section only, and enter the total amount of your expenses in the "Expenses" line. In addition, please fill out the IRS Form W-9, which is included in your folder on check-in.

Note that the Honorarium Request form will specify a payment amount for your participation in the meeting. A separate Travel & Expense Reimbursement Form that itemizes and calculates your travel expenses is provided for your convenience

Expense Reimbursement:

Panelist and Facilitator meals may be claimed at full allowable per diems based on the maximum amount allowed per day as listed below. You may also choose to itemize expenses based on actual expenses incurred during travel. If you itemize travel expenses, original receipts documenting actual charges are required to be submitted with your reimbursement request. Note that Lunch ONLY will be served at the Institute.

According to federal regulations, the per diem for daily meals and incidental expenses is \$71 for the DC metro area. However, the first and last calendar day of travel is calculated at 75 percent of this total (\$53.25). Amounts for any meals provided to you (lunch each day) during your travel should be deducted from your full per diem payment. Please review the chart below for further detail:

| Maximum Allowable Per Diem | | | | |
|----------------------------|---------------------|------------------------|--------------------------|---|
| M&IE | Regular Per Diem | First Day of Travel | Meeting Days Feb 9-12 | Last Day of Meeting & Travel Feb 13 |
| Breakfast | \$12.00 | \$9.00 | \$12.00 | \$9.00 |
| Lunch | \$18.00 | \$13.50 | Provided | Provided |
| Dinner | \$36.00 | \$27.00 | \$36.00 | \$27.00 |
| Incidentals | \$5.00 | \$3.75 | \$5.00 | \$3.75 |
| Total | \$71.00 | \$53.25 | \$53.00 | \$39.75 |

Ground Transportation and Parking:

Panelists and Facilitators will be reimbursed for their Metro fare or cab fare to and from the airport, as well as parking expenses. Please keep your transportation receipts. If participants choose to park onsite at the building housing the NORC offices, please bring your ticket with you and we will validate it during the meeting. (Meeting guests will need to pay for parking using a credit card). If you choose to park at the Hilton Garden Inn, please submit the parking receipt with your travel reimbursement form. Overnight parking at the Hilton is \$15.

Mileage Rate:

Effective January 1, 2015, the U.S. GSA mileage reimbursement rate for privately owned vehicles (POVs), non-government automobiles is \$.575 per mile.

Further Travel and Expense Reimbursement Information:

Travel costs for the *NAEP Content Alignment Institute* in Bethesda, MD to be documented include: any transportation costs (airplane, train, taxi, etc.) and additional meals not covered by NORC. The hotel is direct-billed to NORC, but this does not include incidentals. Any receipts provided as supporting documentation of your expenses should specify method of payment (i.e., cash, credit card, etc.)

In accordance with IRS regulations, we will need to receive reimbursement requests within 30 days of the meeting dates. We will provide a stamped envelope for you to submit your completed reimbursement form, but you may alternatively send your reimbursement materials to:

Attention: Irma Wirawan NORC at the University of Chicago 1155 E. 60th St. Chicago IL 60637 Please contact Isabel Guzman-Barron at guzman-isabel@norc.org or 312-759-4268 with questions about the reimbursement process.

Substitute Reimbursement

If your school district or agency is requesting reimbursement for the cost of a substitute for the five days when you are at the Institute, please have your district or agency send an invoice or reimbursement request for the total amount of substitute costs along with a completed IRS Form W-9 to:

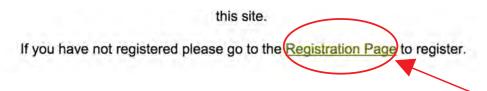

Rolf Blank, Project Director Via email: blank-rolf@norc.org Or mail: NORC at the University of Chicago 4350 East-West Highway, Suite 800 Bethesda, MD 20814-4499 301-634-9325 Appendix H.2: Instructions for Logging Into the WATv2 Tool

Logging in to the WATv2

- **1.** Go to http://watv2.wceruw.org/
- **2.** Click on the "LOGIN" button on the top navigation bar.

3. To register, click on the Registration Page link near the middle of the page.

4. Enter your **group ID**. The ID numbers for each group are listed below:

| | | Group Leader * | Group ID |
|-------------|---------|----------------|----------|
| Mathematics | Group 1 | | 86 |
| | Group 2 | | 87 |
| Reading | Group 1 | | 88 |
| | Group 2 | | 89 |
| | | | |

- 5. Click Submit
- **6.** Confirm that you are in the correct group. Then click **Continue**
- **7.** Complete the questions as best you can. Your password will be sent to the email you enter. If this feature doesn't work, be sure to write down your username and just click to continue.

YOUR USERNAME:

8. Return to the login page, using the login button at the top of the screen, if needed.

9. Enter your username and group ID. Click Login

^{*}Some areas of this document have been redacted for confidentiality requirements.

Appendix H.3: ACT College Readiness Standards EXPLORE Coding Sheets

ACT College Readiness Standards EXPLORE Coding Sheets

ACT College Readiness Standards EXPLORE 2008

| Level | Description | DOK |
|---------|---|-----|
| MID | Main Ideas and Author's Approach (MID) | |
| MID 201 | Recognize a clear intent of an author or narrator in uncomplicated literary narratives | |
| MID 301 | Identify a clear main idea or purpose of straightforward paragraphs in uncomplicated literary narratives | |
| MID 401 | Infer the main idea or purpose of straightforward paragraphs in uncomplicated literary narratives | |
| MID 402 | Understand the overall approach taken by an author or narrator (e.g., point of view, kinds of evidence used) in uncomplicated passages | |
| MID 501 | Identify a clear main idea or purpose of any paragraph or paragraphs in uncomplicated passages | |
| MID 502 | Infer the main idea or purpose of straightforward paragraphs in more challenging passages | |
| MID 503 | Summarize basic events and ideas in more challenging passages | |
| MID 504 | Understand the overall approach taken by an author or narrator (e.g., point of view, kinds of evidence used) in more challenging passages | |
| SUP | Supporting Details (SUP) | |
| SUP 201 | Locate basic facts (e.g., names, dates, events) clearly stated in a passage | |
| SUP 301 | Locate simple details at the sentence and paragraph level in uncomplicated passages\ | |
| SUP 302 | Recognize a clear function of a part of an uncomplicated passage | |
| SUP 401 | Locate important details in uncomplicated passages | |
| SUP 402 | Make simple inferences about how details are used in passages | |
| SUP 501 | Locate important details in more challenging passages | |
| SUP 502 | Locate and interpret minor or subtly stated details in uncomplicated passages | |
| SUP 503 | Discern which details, though they may appear in different sections throughout a passage, support important points in more challenging passages | |

| Level | Description | DOK |
|---------|---|-----|
| REL | Sequential, Comparative, and Cause-Effect Relationships (REL) | |
| REL 201 | Determine when (e.g., first, last, before, after) or if an event occurred in uncomplicated passages | |
| REL 202 | Recognize clear cause-effect relationships described within a single sentence in a passage | |
| REL 301 | Identify relationships between main characters in uncomplicated literary narratives | |
| REL 302 | Recognize clear cause-effect relationships within a single paragraph in uncomplicated literary narratives | |
| REL 401 | Order simple sequences of events in uncomplicated literary narratives | |
| REL 402 | Identify clear relationships between people, ideas, and so on in uncomplicated passages | |
| REL 403 | Identify clear cause-effect relationships in uncomplicated passages | |
| REL 501 | Order sequences of events in uncomplicated passages | |
| REL 502 | Understand relationships between people, ideas, and so on in uncomplicated passages | |
| REL 503 | Identify clear relationships between characters, ideas, and so on in more challenging literary narratives | |
| REL 504 | Understand implied or subtly stated cause- effect relationships in uncomplicated passages | |
| REL 505 | Identify clear cause-effect relationships in more challenging passages | |
| MOW | Meanings of Words (MOW) | |
| MOW 201 | Understand the implication of a familiar word or phrase and of simple descriptive language | |
| MOW 301 | Use context to understand basic figurative language | |
| MOW 401 | Use context to determine the appropriate meaning of some figurative and nonfigurative words, phrases, and statements in uncomplicated passages | |
| MOW 501 | Use context to determine the appropriate meaning of virtually any word, phrase, or statement in uncomplicated passages | |
| MOW 502 | Use context to determine the appropriate meaning of some figurative and nonfigurative words, phrases, and statements in more challenging passages | |

| Level | Description | DOK |

| GEN | Generalizations and Conclusions (GEN) | |
| GEN 201 | Draw simple generalizations and conclusions about the main | |
| GLIV 201 | characters in uncomplicated literary narratives | |
| GEN 301 | Draw simple generalizations and conclusions about people, | |
| GLN 301 | ideas, and so on in uncomplicated passages | |
| GEN 401 | Draw generalizations and conclusions about people, ideas, | |
| GEN 401 | and so on in uncomplicated passages | |
| GEN 402 | Draw simple generalizations and conclusions using details | |
| GLN 402 | that support the main points of more challenging passages | |
| | Draw subtle generalizations and conclusions about | |
| GEN 501 | characters, ideas, and so on in uncomplicated literary | |
| | narratives | |
| GEN 502 | Draw generalizations and conclusions about people, ideas, | |
| GLIN 302 | and so on in more challenging passages | |

Appendix H.4: NAEP 2013
Grade 8 Reading Coding Sheets

NAEP 2013 Grade 8 Reading Coding Sheets

NAEP 2013 Grade 8 Reading

| Level | Description | DOK |
|-------|---|--|
| 1 | Locate/Recall | |
| 1.1 | Both Literary and Informational Text | |
| | Identify textually explicit information and make simple inferences | |
| 1.1.a | within and across texts such as a) definitions; b) facts; or c) | |
| | supporting details | |
| 1.2 | Specific to Literary Text | |
| | Identify textually explicit information within and across text such as | |
| 1.2.a | a) character traits; b) sequence of events or actions; c) setting; or | |
| | d) identify figurative language | |
| 1.3 | Specific to Informational Text | |
| | Identify textually explicit information within and across texts such | |
| 1.3.a | as a) topic sentence, theme, or main idea; b) author's purpose; c) | |
| | causal relations; or d) locate specific information in text or graphics | |
| 1.3.b | Recognize rhetorical devices | |
| 2 | Integrate/Interpret | |
| 2.1 | Both Literary and Informational Text | |
| 2.1.a | Make simple inferences from texts | |
| 2.1.b | Support inferences about a text | |
| 2.1.c | Connect text parts | |
| 2.1.d | Interpret the meaning of a word as it is used in the text | |
| 2.1.e | Make complex inferences within and across texts to describe | across text such as tions; c) setting; or across texts such athor's purpose; c) in in text or graphics the text atts to describe atts to describe how sets |
| 2.1.0 | problem and solution, cause and effect | |
| 2.1.f | Make complex inferences within and across texts to compare or | n the text exts to describe exts to compare or exts to determine |
| 2.1.1 | connect ideas, problems, or situations | |
| 2.1.g | Make complex inferences within and across texts to determine | |
| 2.1.9 | unstated assumptions in an argument | |
| 2.1.h | Make complex inferences within and across texts to describe how | |
| | an author uses literary devices and text features | |
| 2.1.i | Make connections within and across texts | |
| 2.1.j | Locate and provide relevant facts to construct general statements | |
| , | about information from the text | |
| 2.1.k | Analyze text features | |
| 2.1.I | Make and support a connection between characters from two parts of a text | |
| 2.1.m | Identify how figurative language is used in text | |

| Level | Description | DOK |
|-------|---|-----|
| 2.2 | Specific to Literary Text | |
| 2.2.a | Make complex inferences within and across texts to infer mood or tone | |
| 2.2.b | Make complex inferences within and across texts to integrate ideas to determine theme | |
| 2.2.c | Make complex inferences within and across texts to identify or interpret a character's motivations and decisions | |
| 2.2.d | Make complex inferences within and across texts to examine relations between theme and setting or characters | |
| 2.2.e | Make complex inferences within and across texts to explain how rhythm, rhyme, or form in poetry contribute to meaning | |
| 2.2.f | Recognize character actions and infer and support character feelings | |
| 2.2.g | Provide and support judgments about character motivation across texts | |
| 2.2.h | Make and support a connection between characters from two parts of a text | |
| 2.3 | Specific to Informational Text | |
| 2.3.a | Make complex inferences within and across texts to summarize major ideas and themes | |
| 2.3.b | Make complex inferences within and across texts to draw conclusions and provide supporting information | |
| 2.3.c | Make complex inferences within and across texts to find evidence in support of an argument | |
| 2.3.d | Make complex inferences within and across texts to distinguish facts from opinions | |
| 2.3.e | Make complex inferences within and across texts to determine the importance of information within and across texts | |
| 2.3.f | Locate and provide facts and relevant information that support a main idea | |
| 2.3.g | Interpret and explain causal relationships | |

| Level | Description | DOK |
|-------|--|-----|
| 3 | Critique/Evaluate | |
| 3.1 | Both Literary and Informational Text | |
| 3.1.a | Consider text(s) critically to judge the author's craft and technique | |
| 3.1.b | Consider text(s) critically to evaluate the author's perspective or point of view within or across texts | |
| 3.1.c | Consider text(s) critically to take different perspectives in relation to a text | |
| 3.1.d | Fully substantiate judgments about content and presentation of content | |
| 3.1.e | State and justify statements about text features, choice of content, and the author's use of evidence and rhetorical devices | |
| 3.2 | Specific to Literary Text | |
| 3.2.a | Consider text(s) critically to evaluate the role of literary devices in conveying meaning | |
| 3.2.b | Consider text(s) critically to determine the degree to which literary devices enhance a literary work | |
| 3.2.c | Consider text(s) critically to evaluate a character's motivations and decisions | |
| 3.2.d | Consider text(s) critically to analyze the point of view used by the author | |
| 3.3 | Specific to Informational Text | |
| 3.3.a | Consider text(s) critically to analyze the presentation of information | |
| 3.3.b | Consider text(s) critically to evaluate the way the author selects language to influence readers | |
| 3.3.c | Consider text(s) critically to evaluate the strength and quality of evidence used by the author to support his or her position | |
| 3.3.d | Consider text(s) critically to determine the quality of counterarguments within and across texts | |
| 3.3.e | Consider text(s) critically to judge the coherence, logic, or credibility of an argument | |

Appendix H.5: Reading Decision Rules

Reading Decision Rules

NAEP 2013 Grade 8 and ACT EXPLORE Study

February 9-13, 2015

Decision Point 1. Rhetorical Devices

NAEP includes rhetorical devices as the province of non-literary text. When used in discussion of literary text, rhetorical devices are called "literary devices." Given this decision, a rhetorical device is a technique that makes a text more effective and thus enhances communication. Included among many possibilities are repetition, propaganda (although if used wrong it can lessen communication), figurative language (yes, even in non-literary text), examples and illustrations, expert testimony, parallel structure, alliteration, consonance, and many others.

Decision Point 2. Text Parts

Technically text parts would be actual parts of a text such as introduction, body, conclusion, prologue, epilog, table of contents, indices, executive summary, cast of characters, stanza, act, scene, etc. (Notice the inclusion of both non-literary and literary texts.) More useful for this project is also to include in this category what we usually refer to as text features such as sub-headings, bolding, underlining, italics, footnotes, internal definitions, illustrations, charts, and other graphics.

Decision Point 3. The difference between "simple" and "complex" inferences and how to support inferences from text.

The purpose of this alignment is to provide a meaningful comparison of two tests, the NAEP grade eight test and the ACT Explore. The purpose is to permit a meaningful comparison of the two tests. A group of coders will apply the DOK process to the two tests. For this alignment the meaning of "simple" and "complex" inference is not determined by either test or test developer, but by the DOK criteria in the process. The DOK descriptions do not "define" those concepts by a simple statement, but rather by providing examples of each. A level 2 DOK is primarily for simple inferences while more complex ones appear in Level 3. At the same time, the DOK system recognizes that complexity is a continuum. An individual item may lie somewhere between levels 2 and 3. In that event, coders will not always agree on DOK. By having a relatively large number of coders and using two comparable groups of raters, outliers will be filtered out. If about half of raters regard an inference item as level 2 and the other half as level 3, one can be fairly sure that the item lies somewhere in between on the continuum. Adjudication may justifiably end in the same split.

However, despite the fact of the continuum, and decision to define the levels by example rather than definition, the inclusion and placement of examples in the DOK descriptions was made using some general criteria. While recognizing that examples will not always fall at one level when expressed as items, they can usually be expected to fall there. The general criteria (among possible others) include: the amount of text that needs to be processed, the number of texts that must be considered, the degree to which the data needed to make the inference can be found in the text as opposed to the reader's prior

knowledge or reading, the degree to which the reader must "read the writer's mind" to make the inference, the degree to which the reader needs to understand the genre characteristics of the passage in order to make the inference, the degree to which the reader needs to be familiar with the impact of the time period or geographical location in which the text is set, the amount of support required of the reader to support inference, and, in the case of level 4, the amount of time required to provide the required answer.

Decision Point 4. A Decision Point about Decision Points

Although Decision Points are sometimes desirable in determining DOK (for example: "If an item requires processing of information rather than simple recognition or recall, it will not be a DOK 1" or "Selected response items are usually never at level 4 and extended time is necessary but not sufficient in a level 4 item), they are often imperative when assigning an item to a standard/objective, if reliable coding results are expected. The following Decision Points seem necessary for this alignment project:

Decision Point 5. If there is no specific objective to which an item can logically be assigned, assigned it to the generic objective or standard to which such an objective would be attached, and add a note.

Decision Point 6. If there is no place to which an item can be logically assigned, mark it as "uncodable" and add a note explaining why.

Decision Point 7. If an objective can be logically assigned to two or more objectives which mean essentially the same thing, assign it to the most specific objective. If correctly answering the item truly requires knowledge of both objectives, the item can be coded to both. (This should not be done if the two objectives are simply different ways of saying the same thing.)

Decision Point 8. If there is a problem with an item (more than one possible answer, incorrect answer, unfair to some test takers), check "source of challenge" box and explain in space provided.

Decision Point 9. In this alignment, "generalization and conclusion" in ACT is equivalent to "inference" in NAEP test.

Decision Point 10. In ACT, REL refers to causal, sequential, and comparative relationships and usually requires less text than "generalizations" which generally requires more processing of longer texts.

Decision Point 9. In the ACT CRS an uncomplicated literary narrative uses simple language and structure, has a clear purpose, a familiar style, and presents straight forward interactions. More challenging literary narratives make use of figurative language, more intricate structures and messages covered with some subtlety, and may feature somewhat complex interactions between characters.

Decision Point 10. A prose fiction almost always will be a literary text. A humanities passage could be either a literary text or an informational text. A social studies passage almost always will be an informational text.

The genres listed in the 2013 NAEP Framework for Reading should be used to classify the texts as literary or informational.

Literary Texts for Grade 8 NAEP include:

```
Fiction
    Adventure stories (grade 4)
    Historical fiction (grade 4)
    Contemporary realistic fiction (grade 4)
    Folktales (grade 4)
   Legends (grade 4)
    Fables (grade 4)
    Tall tales (grade 4)
    Myths (grade 4)
    Fantasy (grade 4)
    Science fiction
    Plus increasingly complex application of grade 4
Literary Nonfiction
    Personal essay (grade 4)
    Autobiographical and biographical sketches (grade 4)
    Character sketch
    Memoir
    Speech
    Plus increasingly complex application of grade 4
Poetry
    Narrative poem (grade 4)
    Lyrical poem (grade 4)
    Humorous poem (grade 4)
    Free verse (grade 4)
    Ode
    Song (including ballad)
```

Plus increasingly complex application of grade 4

Appendix H.6: Reading Depth of Knowledge (DOK) Definitions

Reading Depth of Knowledge (DOK) Definitions

General Guidelines for Assigning DOK:

- The DOK definitions can be applied to reading standards, tasks, or activities.
- Consider the complexity of the reading demands, not the difficulty for students.
- Consider the experience (prior knowledge) and grade-level expectations of a typical student.
- Do not rely on verbs (describe, explain, evaluate, etc.). Instead, consider the content complexity required for an adequate response.
- For multiple-choice assessment items, consider the item as a whole—including distractors—to judge complexity.
- An expectation or item that is confusing due to error or wording does not reflect increased content complexity—it simply means the statement needs revisions.
- The reading DOK levels were originally based on Valencia and Wixson (2000, pp. 909-935).

DOK 1

DOK 1 involves reading text orally and with basic comprehension, decoding words, blending phonemes, receiving and reciting facts, demonstrating letter and word knowledge, and recognizing text features and common spelling patterns. DOK 1 also includes receiving or reciting facts acquired by processing text as well as reading orally without the analysis of text. Very basic comprehension of a text gained from knowledge of vocabulary and explicit structure of the text is at this level. Tasks require only a shallow understanding of the text presented and often consist of verbatim recall from text, slight paraphrasing of specific details from the text, or simple understanding of a single word or phrase. Younger students who answer direct questions about features stated explicitly in the text are performing at this level. Applying phonics and word analysis skills in decoding words are also DOK 1 tasks. Some examples that represent, but do not constitute all of, DOK 1 performance are:

- Support ideas with reference to verbatim (or only slightly paraphrased) details from the text.
- Use a dictionary to find the meanings of words.
- Recognize figurative language in a reading passage.

DOK 2

DOK 2 involves drawing meaning from text by using organizational structure, evidence, and context; summarizing main ideas, character traits, plots, themes, and figurative use of words; following causeeffect sequences and multiple ideas through a text; distinguishing among hypotheses and givens as well as fact from opinion; and explaining differences among genres (poetry, expository materials, fiction, etc.). DOK 2 requires the engagement of some mental processing beyond recalling or reproducing a response; it requires both comprehension and subsequent processing of text or portions of text. Inter-sentence analysis or inference is required. DOK 2 tasks may require use of specific information from the text to explain given events and ideas. At this level, reading concepts (e.g. making inferences or predictions) are generally applied for purposeful reading. Multiple features of the text are processed to gain a deeper understanding of the text such as organizing in a time sequence, outlining, comparing fact from opinion, and using graphic aides. Deciphering main ideas supported by key details or drawing on details to describe a feature in a story are stressed. Younger students conveying important points from a story fit under this level. DOK 2 ideas, in general, apply the skills and concepts that constitute DOK 1. However, DOK 2 activities involve closer understanding of text, possibly through paraphrasing, such as putting in one's own words both the question and response to an assessment item. Some examples that represent, but do not constitute all of, DOK 2 performance include:

- Use context cues to identify the meaning of unfamiliar words, phrases, and expressions that could otherwise have multiple meanings.
- Predict a logical outcome based on information in a reading selection.
- Identify and summarize the major events in a narrative.

DOK 3

DOK 3 involves conducting analyses of the text to make inferences on author's purpose and use of textual features (e.g. literary devices to support and convey the main message); engaging in critical reading to attest to the credibility of the message, the internal logic, and implied values, attitudes, and biases; and going beyond the text by comparing features and meaning with other texts, considering the impact of the time period and other conditions when the text was written, and raising valid alternative hypotheses and conclusions to those presented in the text. At DOK 3 deep knowledge becomes a greater focus. Students are encouraged to go beyond the text; however, they are still required to show understanding of the ideas in the text. Students may be encouraged to explain, generalize, or connect ideas while applying reasoning and planning. Students must be able to support their thinking. Younger students who provide some valid

evidence for their breakdown of a story into meaningful parts are performing at this level. Tasks at a DOK 3 may involve abstract theme identification, inference across an entire passage with multiple paragraphs, or students' application of prior knowledge. Activities may also involve identifying more abstract connections between texts. Some examples that represent, but do not constitute all of, DOK 3 performance include:

- Explain or recognize how the author's purpose affects the interpretation of a reading selection.
- Summarize information from multiple sources to address a specific topic.
- Analyze and describe the characteristics of various types of literature.

DOK 4

DOK 4 involves at least as complex content as in the previous level, but also requires working on a task over an extended period of time such as when conducting a research project over weeks. The extended time that accompanies this type of activity allows for creation of original work and requires metacognitive awareness that typically increases the complexity of a DOK 4 task overall, in comparison with DOK 3 activities. The extended time period is not a distinguishing factor if the required work is only repetitive and does not require the application of significant conceptual understanding and higher-order thinking. DOK 4 activities may have students take information from multiple passages and texts to find supporting evidence and counter points for developing an argument or reaching conclusions or could involve creating an original thesis on a topic based on information drawn from relevant references. For younger students, an extended period of time could be multiple days for reaching conclusions from reading a number of texts. Students take information from multiple passages and are asked to apply this information to a new task. They may also be asked to develop hypotheses and perform complex analyses of the connections among texts requiring work over an extended period of time. Some examples that represent, but do not constitute all of, DOK 4 performance are:

- Analyze and synthesize information from multiple sources.
- Examine and explain alternative perspectives across a variety of sources.

Describe and illustrate how common themes are found across texts from different cultures.

Appendix H.7: DOK Definitions Level (Reading)

DOK Definitions Level (Reading)

| | Depth of Knowledge | | | | | |
|-----------------------|---|---|---|--|--|--|
| Subject | Level 1 | Level 2 | Level 3 | Level 4 | | |
| English Language Arts | Requires students to recall, observe, question or represent facts or simple skills or abilities. Requires only surface understanding of text often verbatim recall or slight paraphrasing. Use conventions of Standard English. Examples: Support ideas by reference to specific details in text Use dictionary to find meaning Use punctuation marks correctly Identify figurative language in passage Identify correct spelling or meaning of words | Requires processing beyond recall and observation. Requires both comprehension and subsequent processing of text. Involves ordering, classifying text as well as identifying patterns, relationships and main points. Connect ideas using simple organizational structures. Requires some scrutiny of text. Examples: Use contextual clues to identify unfamiliar words Predict logical outcome Construct or edit compound or complex sentences Identify and summarize main points Apply knowledge of conventions of standard American English Compose accurate summaries | Requires students to go beyond text. Requires students to explain, generalize and connect ideas. Involves inferencing, prediction, elaboration and summary. Requires students to support positions using prior knowledge and to manipulate themes across passages. Students develop compositions with multiple paragraphs. Examples: Determine effect of author's purpose on text elements Summarize information from multiple sources Critically analyze literature Edit writing to produce logical progression Compose focused, organized, coherent, purposeful prose | Requires extended higher order processing. Typically requires extended time to complete task, but time spent not on repetitive tasks. Involves taking information from one text/passage and applying this information to a new task. May require generating hypotheses and performing complex analyses and connections among texts. Examples: Analyze and synthesize information from multiple sources Examine and explain alternative perspectives across sources Describe and illustrate common themes across a variety of texts Create compositions that synthesize, analyze, and evaluate | | |

Appendix H.8: Facilitator Instructions

Facilitator Instructions*

NAEP and ACT EXPLORE Content Alignment Study

February 9-13, 2015 | By Norman Webb

The NAEP-ACT EXPLORE study is a little different from the typical content alignment study. In analyzing the 2013 grade 8 NAEP assessments and the ACT EXPLORE, we will be doing an assessment to an assessment study as compared to analyzing curriculum standards with an assessment. In order to make a comparison between the two assessments, the design requires mapping each assessment to the standards or expectations used by NAEP and used by ACT. The degree of alignment between the two assessments will be determined by inferring from the data how the two assessments compare to the NAEP grade 8 standards and objectives and how the two assessments compare to the ACT College Readiness Standards (CRS).

Another difference with the design of this study is there will be two groups for each content area. The groups are to code the data independently so there will be a measure of consistency in coding. This will assure the findings are more reliable. In order for this to work, it is important that the process followed by each group be consistent. That is, one facilitator should not make arbitrary decisions or come up with decision rules for his or her group during the coding process. The design does allow for adjudication of the data within and between groups. The two facilitators for a content area should review the two frameworks prior to the study and come to agreement on how to code statements with possible ambiguity. This has to be done before the institute so these decisions can be incorporated in the training.

A third difference in this study is your role which is to facilitate the group process and not to code the data yourself. You need to monitor the progress of each panelists and help to be sure the panelists are keeping pace with the others. You should also look at data on the WATv2 to identify when and what adjudication will be needed. I will also be doing this and will keep in communication with all of you during the institute. The five of us will meet at the end of each day to review the progress made and to address any issues that may arise.

Pre-institute

1. I will send each of you a framework comparison paper that was done for the study. In this paper Raven McCrory (Michigan State) for mathematics and Karen Wixson (Univ of NC Charlotte) for reading conducted the analysis. In each report there is a side-by-side chart that compares and contrasts the NAEP framework with the ACT College Readiness Standards. I will also send you the coding sheets that will be used, one listing the NAEP expectations and one listing the ACT CRS expectations. You should read this report to understand some of the background of each of the frameworks. You should also look for issues that may arise because a standard or expectation in one framework uses different

- wording that in the other framework or does not explicitly include a topic, or any other issue that made cause panelists to code an item to one standard rather than another.
- 2. At least one week before the institute and after reading the framework paper, talk with your partner facilitator and decide between the two of you how specific issues should be addressed by reviewers and what should be included in the training of the panelists. For example, the ACT CRS does not include standards addressing coordinate geometry. You should be clear with each other that a coordinate geometry item on the NAEP assessment would be coded to the generic standard of "Graphical Representation" (GRE). In reading, NAEP has expectations that students make complex inferences across texts whereas the ACT CRS only includes a single text. A NAEP item that requires students to make inferences from more than one text then would need to be coded under the ACT CRS as a standard under "Generalization and Conclusions" (GEN) with a note that the item included two passages.
- 3. Will lead the training for reading and will lead the training for mathematics. Please be aware of the time limits we have for training. You will need to set a priority of what is the most important part of the process to include in the training. Panelists should be well versed in the DOK definitions and have an understanding of certain decision rules. You will be able to discuss in more detail specific decision rules when the panelists assign DOK levels to the frameworks.*
- 4. You also will be sent a copy of the agenda. Please make note of the time schedule and what needs to be completed by a specific day and time. We need to keep to the schedule in order to get the planned steps completed in the five days.
- 5. You need to read the DOK definitions. These have been revised from our last alignment study and hopefully will help clarify points of differences in the past. You need to be well versed in the new version of the definitions.

During the Institute

- 6. I will provide a general training on the process (about 30 minutes). I will just cover the general design of the study and a basic description of the DOK levels.
- 7. You will have from 10:45 to 12:45 on Monday morning to train the panelists on the DOK levels, general decision rules you have prepared, and the use/login of the WATv2. This will be one of the few times that the two groups for a content area will work together. You need to work with your partner to determine how you will divide the work between the two facilitators for the training. The purpose of this training with the combined groups is to have a common understanding of the DOK definitions and decision rules by all of the panelists for a content area.

There will be enough time for panelists to have a workable knowledge of DOK levels. As noted in 3 above, you need to prepare your training to fit the time available and to use the time efficiently. This does not mean you should read the DOK definitions to the panelists. You need to have the panelists read the definitions and then you need to quiz them on major points and differences among the levels.

- 8. By 1:30 PM on Monday, every panelists should have a general understanding of the DOK levels and the process. They should also be logged on to the WATv2.
- 9. For assigning DOK levels to the NAEP framework, the two groups will work independently. Have each panelist log on to the WATv2 and Part I to enter a DOK level for each of the objectives listed in the NAEP grade 8 framework. You can check on their progress and identify objectives with any variation among the eight panelists. If only one or two panelists differ from the others, then ask for a reason for each and without a compelling difference take the majority value and move on. Only discuss in great detail (within reason) when three or more levels have been assigned to one objective or when the panelists are split between two DOK levels (4-4 or 5-3). You should let the opinion of the eight panelists determine the DOK level even if their opinion differs from your own. If panelists cannot come to agreement, then you can work to negotiated the panelists to a consensus level and then more on.

Remember, the phase for assigning a DOK to the NAEP framework should be considered additional training on the DOK level definitions. Be sure to have people justify their arguments for a DOK assignment by going back to the definitions. Be sensitive and on the lookout for panelists who do not fully understand the DOK levels as appropriate. Offer these panelists additional explanation either in the group or on the side to increase their understanding.

- 10. The two reading groups should be done coding the NAEP framework by 3:15 PM on Monday. The two mathematics groups should be done coding the NAEP framework by 4:00 PM. Give your groups a brief break at this time while the two group leaders meet with me to determine what differences in the codings of the DOK to the NAEP framework between the two groups need to be discussed. These differences then will be discussed by the content area group as a whole (16 panelists) facilitated by the lead facilitator. Again, this should be considered an important part of being sure all of the panelists have a common understanding of the DOK levels for the content area.
- 11. At the end of the day on Monday, I will meet with all four of the facilitators to review the day and discuss any adjustments that need to be made in pacing, extra training for individual panelists, or any other issues.

12. On Tuesday I will conduct a brief process check with all 32 panelists and the four facilitators. Then the panelists will divide into two groups by content area. The lead facilitator is to go over the process for coding assessment items to the NAEP framework (Part II). Panelists need to be told that if they cannot find a good match between an item and any of the objectives or specific expectations, they should code the item to the more general expectation or "generic standard." They also need to be told for open-ended items to consult the scoring rubric to decide on the DOK level of the item. They should be told to write a brief, but complete thought, as a Note to clarify their coding if needed. For example, if the assessment item only targets a small part of an expectation, then this should be noted. Panelists should also be told about source-of-challenge and this should be used if they find an item where there is an error so that a student may answer the item correctly without having the knowledge being targeted or answer the item incorrectly even though they have the knowledge.

The groups then should be separated into two groups for each content area. Then the panelists should code five items and then discuss their codings with each other to be sure they understand the process. Again, this needs to be done efficiently without taking too much time. Then have the panelists code the NAEP assessment items to the NAEP framework. Panelists should write the DOK for each item on the printed page. Because they will need to enter the DOK level again when they code the NAEP items to the ACT CRS. This coding should go until 3:00 PM on Tuesday. During this time you should monitor the coding of the panelists and respond to any questions. If a panelist asks about what is a correct answer for an item, asked me to look at the NAEP answer key.

After all of the panelists have finished coding, then review the data on the WATv2 to see what codings need to be adjudicated. Any item without a majority (N=5) of the reviewers in agreement on the assignment of an objective or standard should be discussed among the panelists within a group. If any item was assigned three or more different DOK levels, then these items should be discussed to resolve the differences. The desired Intraclass correlation for the coding of DOK levels across the items is 0.70 or higher. If the Intraclass correlation is below 0.70 look for one or two panelists that consistently coded differently from the rest of the group and indicate to these panelists that they are coding consistently lower or higher than the group and point this out with a couple of items. The desired pairwise agreement for an objective is 0.80 and for a standard is 0.90. If the initial statistics are way below these values, then try to find items where panelists varied in their coding by objective or standard. The NAEP framework could have some overlapping expectations that would result in a variation among coding. If this is the case then the desired levels above may not be reached.

After you discuss with your group the variation in coding, the panelists should be given the opportunity to return to the WATv2 and change their codings. It is not necessary for

- any panelist to change their coding if they do not think the discussion produced a compelling reason to do so.
- 13. The test items for both the NAEP and the ACT are secured documents. NORC will distribute confidentiality statements to be signed by all panelists and facilitators. Panelists will need to sign out and sign in a test form from NORC staff. Test forms will be numbered so each reviewer should be assigned a number and receive the test with the same number for each assessment analysis.
- 14. Once the within-group adjudication has been completed and panelists have made changes to their coding, then I will look at the results from each of the groups for a content area. I will note significant differences in the results between the two groups that need to be justified. Then I will discuss with the two facilitators if some adjudication needs to be done with all 16 panelists for the content area.
- 15. The group would continue with the next step, coding the ACT EXPLORE assessment items to NAEP standards and objectives after the within-group adjudication. Do not wait for the between-group adjudication.
- 16. At the end of day on Tuesday, panelists will be ask to complete a feedback survey to provide information on training and their opinion on the process being used.
- 17. Before coding the ACT EXPLORE to the NAEP standards and objectives, have the panelist within a group code five items individually and then discuss the results as a group to be sure each panelist understands the process.
- 18. Repeat the process for coding the ACT EXPLORE items to the NAEP expectations. This should begin at least at the beginning of Wednesday morning. ACT staff will be available at the institute to answer questions and provide the answer key to any item if needed. There will be two ACT EXPLORE test forms that will need to be coded. Use the same process for adjudication as discussed above.
- 19. The coding of the ACT EXPLORE items to the NAEP expectations should be completed by noon on Wednesday. Each form only has 30 items.
- 20. After lunch on Wednesday, have reviewers code the DOK levels to the ACT College Readiness standards. Repeat the same steps as described in number 9 and 10 above for the NAEP standards and objectives.
- 21. You should finish coding the DOK levels to the ACT CRS and adjudicate by the end of the day on Wednesday.

- 22. On Thursday, begin by coding the NAEP assessment items to the ACT CRS. This part of the coding should be done with adjudication by the end of Thursday and follow the same procedures as discussed in number 12 above. Panelists will be asked to complete another feedback survey at the end of the day on Thursday.
- 23. On Friday morning, the panelist should code the two ACT EXPLORE assessments to the ACT CRS following the same procedures as discussed in number 12 above.
- 24. Panelists should not be dismissed until all of the tests have been turned in and accounted for and you have checked with me.

^{*}Some areas of this document have been redacted for confidentiality requirements.

Appendix I.1: Group Consensus DOK Values for the 2013 NAEP Grade 8 Reading Framework: Panels 1 and 2

Appendix I.1

Group Consensus DOK Values for the 2013 NAEP Grade 8 Reading Framework: Panels 1 and 2

Table 14
Group Consensus
NAEP 2013 Grade 8 Reading, Language Arts, Grade 8

| Level | Description | DOK |
|-------|--|-----|
| 1 | 1. Locate/Recall | 1 |
| 1.1 | Both Literary and Informational Text | 1 |
| 1.1.a | Identify textually explicit information and make simple inferences within and | 1 |
| | across texts such as a) definitions; b) facts; or c) supporting details | 1 |
| 1.2 | Specific to Literary Text | 1 |
| 1.2.a | Identify textually explicit information within and across text such as a) | |
| | character traits; b) sequence of events or actions; c) setting; or d) identify | 1 |
| | figurative language | |
| 1.3 | Specific to Informational Text | 2 |
| 1.3.a | Identify textually explicit information within and across texts such as a) topic | |
| | sentence, theme, or main idea; b) author's purpose; c) causal relations; or d) | 2 |
| | locate specific information in text or graphics | |
| 1.3.b | Recognize rhetorical devices | 1 |
| 2 | Integrate/Interpret | 3 |
| 2.1 | Both Literary and Informational Text | 2 |
| 2.1.a | Make simple inferences from texts | 2 |
| | Support inferences about a text | 2 |
| | Connect text parts | 2 |
| | Interpret the meaning of a words as it is used in the text | 2 |
| 2.1.e | Make complex inferences within and across texts to describe problem and | |
| | solution, cause and effect | 2 |
| 2.1.f | Make complex inferences within and across texts to compare or connect | 2 |
| | ideas, problems, or situations | 3 |
| 2.1.g | Make complex inferences within and across texts to determine unstated | 2 |
| | assumptions in an argument | 3 |
| 2.1.h | Make complex inferences within and across texts to describe how an author | 2 |
| | uses literary devices and text features | 3 |
| 2.1.i | Make connections within and across texts | 2 |
| 2.1.j | Locate and provide relevant facts to construct general statements about | 2 |
| 3 | information from the text | 2 |
| 2.1.k | Analyze text features | 3 |
| | Make and support a connection between characters from two parts of a text | 2 |
| | Identify how figurative language is used in text | 2 |
| 2.2 | Specific to Literary Text | 3 |
| | Make complex inferences within and across texts to infer mood or tone | 3 |

| | Make complex inferences within and across texts to integrate ideas to determine theme | 3 |
|-------|--|----|
| | | |
| | Make complex inferences within and across texts to identify or interpret a character's motivations and decisions | 3 |
| 2.2.d | Make complex inferences within and across texts to examine relations | 3 |
| | between theme and setting or characters | 3 |
| 2.2.e | Make complex inferences within and across texts to explain how rhythm, | 3 |
| | rhyme, or form in poetry contribute to meaning | 3 |
| | Recognize character actions and infer and support character feelings | 2 |
| | Provide and support judgments about character motivation across texts | 3 |
| | Make and support a connection between characters from two parts of a text | 2 |
| | Specific to Informational Text | 3 |
| | Make complex inferences within and across texts to summarize major ideas | _ |
| | and themes | 3 |
| 2.3.b | Make complex inferences within and across texts to draw conclusions and | |
| | provide supporting information | 3 |
| | Make complex inferences within and across texts to find evidence in support | |
| | of an argument | 3 |
| | Make complex inferences within and across texts to distinguish facts from | |
| | opinions | 2 |
| | Make complex inferences within and across texts to determine the importance | _ |
| 2.5.0 | of information within and across texts | [3 |
| 2.3 f | Locate and provide facts and relevant information that support a main idea | 2 |
| | Interpret and explain causal relationships | 2 |

Appendix I.2

Group Consensus DOK Values for the ACT College Readiness Standards for the 2013 ACT EXPLORE Reading: Panels 1 and 2

Table 14
Group Consensus
ACT College Readiness Standards Reading 2008, Language Arts, Grade 8

| Level | Description | DOK |
|---------|---|-----|
| MID | Main Ideas and Author's Approach (MID) | 2 |
| MID 201 | Recognize a clear intent of an author or narrator in uncomplicated literary narratives | 2 |
| MID 301 | Identify a clear main idea or purpose of straightforward paragraphs in uncomplicated literary narratives | 1 |
| MID 401 | Infer the main idea or purpose of straightforward paragraphs in uncomplicated literary narratives | 2 |
| MID 402 | Understand the overall approach taken by an author or narrator (e.g., point of view, kinds of evidence used) in uncomplicated passages | 2 |
| MID 501 | Identify a clear main idea or purpose of any paragraph or paragraphs in uncomplicated passages | 1 |
| MID 502 | Infer the main idea or purpose of straightforward paragraphs in more challenging passages | 2 |
| MID 503 | Summarize basic events and ideas in more challenging passages | 2 |
| MID 504 | Understand the overall approach taken by an author or narrator (e.g., point of view, kinds of evidence used) in more challenging passages | 2 |
| SUP | Supporting Details (SUP) | 2 |
| SUP 201 | Locate basic facts (e.g., names, dates, events) clearly stated in a passage | 1 |
| SUP 301 | Locate simple details at the sentence and paragraph level in uncomplicated passages\ | 1 |
| SUP 302 | Recognize a clear function of a part of an uncomplicated passage | 2 |
| SUP 401 | Locate important details in uncomplicated passages | 1 |
| SUP 402 | Make simple inferences about how details are used in passages | 2 |
| SUP 501 | Locate important details in more challenging passages | 2 |
| SUP 502 | Locate and interpret minor or subtly stated details in uncomplicated passages | 2 |
| SUP 503 | Discern which details, though they may appear in different sections throughout a passage, support important points in more challenging passages | 3 |
| REL | Sequential, Comparative, and Cause-Effect Relationships (REL) | 2 |
| REL 201 | Determine when (e.g., first, last, before, after) or if an event occurred in uncomplicated passages | 1 |
| REL 202 | Recognize clear cause-effect relationships described within a single sentence in a passage | 1 |
| REL 301 | Identify relationships between main characters in uncomplicated literary narratives | 2 |
| REL 302 | Recognize clear cause-effect relationships within a single paragraph in uncomplicated literary narratives | 2 |
| REL 401 | Order simple sequences of events in uncomplicated literary narratives | 2 |
| REL 402 | Identify clear relationships between people, ideas, and so on in uncomplicated passages | 2 |
| REL 403 | Identify clear cause-effect relationships in uncomplicated passages | 2 |

| REL 501 | Order sequences of events in uncomplicated passages | 2 |
|---------|---|---|
| REL 502 | Understand relationships between people, ideas, and so on in uncomplicated passages | 2 |
| REL 503 | Identify clear relationships between characters, ideas, and so on in more challenging literary narratives | 2 |
| REL 504 | Understand implied or subtly stated cause- effect relationships in uncomplicated passages | 2 |
| REL 505 | Identify clear cause-effect relationships in more challenging passages | 2 |
| MOW | Meanings of Words (MOW) | 2 |
| MOW 201 | Understand the implication of a familiar word or phrase and of simple descriptive language | 2 |
| MOW 301 | Use context to understand basic figurative language | 2 |
| MOW 401 | Use context to determine the appropriate meaning of some figurative and nonfigurative words, phrases, and statements in uncomplicated passages | 2 |
| MOW 501 | Use context to determine the appropriate meaning of virtually any word, phrase, or statement in uncomplicated passages | 2 |
| MOW 502 | Use context to determine the appropriate meaning of some figurative and nonfigurative words, phrases, and statements in more challenging passages | 2 |
| GEN | Generalizations and Conclusions (GEN) | 2 |
| GEN 201 | Draw simple generalizations and conclusions about the main characters in uncomplicated literary narratives | 2 |
| GEN 301 | Draw simple generalizations and conclusions about people, ideas, and so on in uncomplicated passages | 2 |
| GEN 401 | Draw generalizations and conclusions about people, ideas, and so on in uncomplicated passages | 2 |
| GEN 402 | Draw simple generalizations and conclusions using details that support the main points of more challenging passages | 2 |
| GEN 501 | Draw subtle generalizations and conclusions about characters, ideas, and so on in uncomplicated literary narratives | 2 |
| GEN 502 | Draw generalizations and conclusions about people, ideas, and so on in more challenging passages | 3 |

Process Evaluation Survey I Table Results

NAEP-ACT Content Alignment Institute: February 9-13, 2015

Panelist Feedback Survey I (conducted Day 2 at 5 p.m.)

A. Training

We are interested in your feedback about this institute. Below, please respond to each statement indicating the extent to which you agree or disagree. Your responses will be kept confidential.

| | Strongly disagree | Disagree somewhat | Neither disagree/agree | Agree somewhat | Strongly agree |
|--|-------------------|----------------------|---------------------------|-------------------|-----------------|
| The training materials were easy to understand. | 0 | 0 | 2 (6%) | 10 (30%) | 21 (64%) |
| 2. The facilitator was effective in explaining the coding process. | 0 | 1 (3%) | 2 (6) | 8 (24) | 22 (67) |
| 3. I understood the criteria used to code the standards and items. | 0 | 1 (3) | 1 (3) | 11 (20) | 20 (61) |
| 4. There were a sufficient number of examples to practice. | 1 (3%) | 5 (15) | 3 (9) | 12 (36) | 12 (36) |
| 5. I had adequate time to practice coding. | 1 (3) | 6 (18) | 5 (15) | 10 (30) | 11 (33) |
| 6. There were ample opportunities to discuss and resolve coding discrepancies. | 1 (3) | 6 (18) | 4 (12) | 11 (33) | 11 (33) |
| 7. The rules for resolving coding discrepancies were clear. | 1 (3) | 6 (18) | 3 (9) | 9 (14) | 14 (42) |
| 8. The training sessions were well organized and well placed. | 0 | 4 (12) | 3 (9) | 8 (24) | 18 (55) |

B. Process evaluation

| | Strongly disagree | Disagree somewhat | Neither disagree/agree | Agree somewhat | Strongly agree |
|--|----------------------|----------------------|---------------------------|-------------------|----------------|
| The training session adequately prepared me for the coding. | 0 | 3 (9%) | 1 (3%) | 16 (48%) | 13 (39%) |
| 2. The facilitator was effective in assisting the panel with the coding process. | 0 | 1 (3) | 4 (12) | 10 (30) | 18 (55) |
| 3. I felt at ease applying the criteria to the standards and items. | 0 | 3 (9) | 2 (6) | 14 (42) | 14 (42) |
| 4. I had an adequate amount of time to code the standards and items. | 1 (3%) | 10 (30) | 1 (3) | 10 (30) | 11 (33) |

Panelist Feedback Survey II (conducted Day 4 at 5 p.m.)

A. Process Evaluation

We are interested in your feedback about this institute. Below, please respond to each statement indicating the extent to which you agree or disagree. Your responses will be kept confidential.

| | Strongly disagree | Disagree somewhat | Neither disagree/agree | Agree somewhat | Strongly agree |
|--|-------------------|----------------------|---------------------------|-------------------|-----------------|
| 1. The facilitator was effective in explaining the coding process. | 0 | 1 (3%) | 0 | 8 (23%) | 26 (74%) |
| 2. I felt at ease applying the criteria to the standards and items. | 0 | 1 (3) | 1 (3) | 11 (20) | 20 (61) |
| 3. I had adequate amount of time to code the standards and items. | 1 (3) | 3 (9) | 4 (11) | 15 (43) | 12 (34) |
| 4. My final codes were often influenced by other panelists. | 2 (6) | 4 (11) | 14 (40) | 11 (31) | 4 (11) |
| The coding results of my team accurately reflected the alignment between the assessments and the frameworks. | 0 | 0 | 2 (6) | 14 (40) | 19 (54) |

Appendix J.4: Survey Results Description

Survey Results Description

Participant feedback was requested through a short survey given to all panelists. The first survey was administered at the end of the second day of the five-day CAI. This survey was comprised of two types of structured-response items that asked about: (a) training they had received for the content analysis process, and (b) their evaluation of the process of review and coding of standards and assessments. The second survey given at the end of day four of the Institute was comprised of structured questions regarding the panelists' evaluation of the process toward the end of their experience, and open-ended questions asking for specific issues they identified about the content analysis process.

The responses to items on Survey I are displayed in Appendix J.3 (Survey I, Tables A and B) and the data show highly positive views of the training and the process of content analysis by the panelists. Regarding the training, over 90 percent of panelists responded that the training materials were easy to understand (64 percent strongly agree, 30 percent agree), 90 percent of panelists found the facilitator was effective in explaining the coding process (22 percent strongly agree, 24 percent agree), and over 90 percent understood the criteria used in coding (61 percent strongly agree, 33 percent agree). While the data do show overall positive responses to the training process, the data also show room for improvement. Over two-thirds of respondents indicated there were a sufficient number of examples to practice (72 percent), a majority (63 percent) of panelists said they had adequate time to practice coding (21 percent wanted more time), and 66 percent indicated they had ample opportunities to discuss and resolve discrepancies (with 21 percent wanting more time for discussion/resolution). Regarding the organization of the training, responses were overall positive-- with 69 percent of panelists indicating the rules resolving discrepancies were clear, and 79 percent indicating the training sessions were well organized and well placed.

The questions for panelists regarding the process of content analysis showed very positive responses, and the panelists' views of the process did improve as the Institute proceeded (Appendix J.3, Survey II Table A, Process Evaluation). In the survey on day two, 88 percent of panelists indicated they were adequately prepared for the coding, and 84 percent reported on day two that the facilitator was effective in assisting panelists and the coding process. The change in responses on several evaluation items indicate improved attitudes by the end of the week. On day four of the Institute, a total of 97 percent of panelists thought their facilitator was effective, 97 percent felt at ease in applying the analysis criteria (improving from 84 percent on day two), and 78 percent felt they had adequate time to do the coding work (improving from 63 percent on day two). Thus about one-fourth of panelists did feel they could have used more time to do their analysis. Two questions were given to panelists on day four to report on their views of the work of

their panel. A total of 94 percent of panelists felt the results of their coding team accurately reflected the alignment between assessments and frameworks (i.e., outcomes validity). Panelists were split on whether their codes were influenced by others in the group (44 percent indicated they were influenced by other while 40 percent were neutral—neither disagree or agree). The design of the content analysis is structured to move toward a consensus in the analysis and codes among the panel members, and thus panelists work is very likely to be influenced by the views of others.

The open-ended questions in the day four survey asked about aspects of the coding process that were difficult for the panelists and what suggestions they would have for improvement of the process. The primary difficulty identified by respondents was being able to comprehend the standards and framework well enough to provide a good match to content of assessment items, although a number of panelists indicated this step improved with greater familiarity and knowledge by the end of the Institute. The differences in structure of the ACT standards (broad) and NAEP framework objectives (specific) were listed as a difficulty, and for some matching the NAEP assessment items to the ACT standards was hard to accomplish. Third, the limited amount of time available was an issue and for some the number of NAEP items to be coded in one day was difficult. Several panelists wrote that they would have liked more time in training with the standards and more time in team discussion of DOK levels and others suggested that work at home prior to the Institute could have provided background on understanding the standards and objectives.
